Mr. Gray reminds Mr. Debs that "our fair-minded Judge Gary is to sit on the bench again." It is impossible to understand how a man can become so wholly lost to all sense of self-respect, so morally degraded and so incomparably stupid and ignorant as to expose himself to the ridicule, pity, or contempt, as they may happen to see it, of all intelligent people, as Mr. Gray has here done. If Judge Gary is a fair-minded judge, then so was the judge who sentenced Robert Emmet to death for the crime of being a patriot, a lover of his country and of liberty, and a man of unflinching courage and unswerving purpose; who said to the judge in his famous speech from the dock: "My lord; you are a man and I am a man; by a revolution of power we might change places, but we never could change characters." The Anarchists of Chicago might have said the same, with equal truth, to the "fair-minded Judge Gary." If he is a fair-minded judge, then so are the Russian judges, who merely do the Czar's bidding, and sentence men to death or exile without even the formality of a trial. As to Gary's re-election, it was necessary to the accomplishment of the purpose of the "citizens' club," spoken of by Mr. Deegan, in the January MAGAZINE, and their pals in iniquity, so as to make it appear that his conduct was approved by those who must suffer the most from it; and they were bound to procure it at any cost, which they did. What his election did cost them will, of course, never be known, but as for the workingmen (slaves) who voted for him, they deserve all the misery that their masters inflict upon them. They prove to the enlightened world that they have prostituted themselves to the last degree; that they are wholly devoid of feelings of self-respect or manhood; ignorant slaves, in head, heart, body and soul, as completely as if they were branded with their master's initials, and they do not deserve to be free. He does not deserve to be

free who will not inform himself as to that in which his freedom consists. And these men do not know in what their freedom consists. Mr. Gray has his uses; he is doing more to disseminate the truth about the Anarchist trial, through the MAGAZINE, that reaches so many people all over this broad country, than the most ardent friend of the Anarchists and their cause could do. The more he stirs up his "fair-minded Judge Gary" the more he stinks—and he is rotten enough to stink a whole nation if he is only stirred up enough—while the more he rubs Debs and Altgeld the brighter they shine and the more useful they become.

He says that Governor Altgeld committed political suicide. This may be true from the standpoint of the politician for revenue only, but he will be alive in history and illuminating its pages with dazzling brilliancy, sharing honors with Debs, when the Garys, the Grays, and the many other slimy things which now curse this earth with their foul presence will be as forgotten, dead, damned, and delivered in the bottomless ocean of oblivion as if they had never been in existence.

GRAND JUNCTION, COL. P. W. Monahan.

#### Free Transportation.

MR EDITOR:—The old question of transportation is revived by the attempt of some of the roads to substitute rates for passes among their employees. Passes should be given as a matter of course to any person traveling on business for the company. On any other occasion rates seem, to my mind at least, fairer to both parties. Merchants make a practice of selling goods to their clerks at wholesale prices; why should not railroad men be satisfied if furnished transportation at wholesale prices?

Several brotherhood men with whom I have spoken on the subject say they would rather buy a ticket at a reasonable price than to go through the red tape necessary to secure a pass. Besides, a pass seems like a favor, and a ticket a right.

On many Pacific roads the terminal point of a division is often an insignificant cluster of houses about a round house, twenty miles or more from the chief town of the district. If an engineman desires to do his trading in town, and the usual rule of one pass a year is enforced, he goes to town once on a pass and the rest of the year he pays full fare or "beats his way"—generally the latter. At a rate of one cent, or one-half cent a mile he and his family would make the trip two or three times a month, to the benefit of themselves, the business of the town and the railroad company. However, though many employees would be satisfied with rates, nobody doubts that the passes denied to trainmen will still be given once

a year and a great many times a year to people who are amply able to pay fare.

Grant that employees are not entitled to passes except when traveling on company's business. Then, in justice, why should an official more than an ordinary employe be allowed passes when traveling on his own business or for pleasure? And yet, who ever heard of a railroad officeholder of any description paying fare? Even the friends, relatives, business associates, and servants of an officer of the company commonly enjoy privileges denied the men who actually handle the trains.

Is it fair? That question comes up in my mind every time I find a fellow traveler with a handful of passes kindly furnished by friends in the office. One young lady I met had passes over two routes from Chicago to the Pacific coast. She preferred a third route and paid full fare. I thought rather bitterly of the rule, "Employees are forbidden to ask for favors beyond the limits of their own line," and how dreadfully short some lines are.

By the way, speaking of officials, in all the talk about "reduction of expenses made necessary by hard times," has anybody heard of a reduction in the big salaries of the general offices? Is not economy there as necessary as on the road? Surely, a man of independent fortune, who is paid from \$5 to \$25 a day, can stand a 10 per cent. reduction better than the man who earns from \$1 to \$5. Furthermore, the saving in one such salary would outweigh ten times the pitiful sum shaved off from mere wages. It is a strange sort of logic that can prove a company at once rich enough to continue paying high salaries in the office and too poor to pay its section men their usual wages. There is something about it suggestive of the old saying of throwing out with a shovel what has been saved with a spoon. How absurdly insolent for gentlemen with pockets full of passes, and salaries untouched by "hard times," to demand that workmen shall pay fare on their few excursions and take fifty cents a day less for a day's hard work.

Restriction in the matter of passes and cuts in pay will be more enthusiastically received by that army of sufferers, the working force of the road, if it is understood that the restriction touches officers as well as men, and that the cut affects the top as well as the bottom of the list.

Any imposition suffered by employees reacts inevitably on the company in poor service, and, *vice versa*, fair treatment results in good work. As a matter of business it does not pay to be mean, and strikes will go out of fashion when all the sacrifices are not required from the tin pail brigade.

Pay your way and we will pay ours.

OAKLAND, CALIF.

Emely L. Baker.

EX-GOVERNOR JOHN H. GEAR, of Iowa, who is a candidate for United States Senator in that state, got his nickname of "Old Business" from a celebrated notice which he served on the officials of a railroad during the winter of 1879. At that time the northern part of Iowa was visited by a severe blizzard, which snowed under the line of the St. Paul railroad, and the company taking no steps to clear the tracks, great hardship was suffered by the settlers, who ran short of fuel and other necessities. The situation was explained to Governor Gear, and becoming satisfied that greater hardship would result if the road was not opened, he sent the following dispatch:—"To the officials of the Chicago, Milwaukee & St. Paul railroad: If you don't open up the Milwaukee road to Emmetsburg, I will. John H. Gear, Governor." The road was opened after the receipt of this telegram.—*Evening Post*.

### Wonders of the Human Heart.

The workings of the human heart have been computed by a celebrated physiologist, and he has demonstrated that it is equal to the lifting of 120 tons in twenty-four hours! Presuming that the blood is thrown out of the heart at each pulsation in the proportion of sixty-nine strokes per minute, and at the assumed force of nine feet, the mileage of the blood through the body might be taken at 207 yards per minute, seven miles per hour, 168 miles per day, 61,320 miles per year, or 5,150,880 miles in a life time of 84 years. In the same period of time the heart must beat 2,869,776,000 times.

A PARIS dispatch of Jan. 8 says "A man whose name has not been ascertained was robbed and murdered on a railway train between Balvigny and St. Gothard last night. The body was thrown from the train and the murderers escaped." Incidents of this kind on European railways are almost as common as train robberies in the United States. On the whole, we would much rather be robbed in company than robbed in solitude and murdered besides. The American car still has advantages over the compartment carriage.—*Railway Age*.

THE value of saving something from wages is very well illustrated in France just now. In the universal business stagnation in Europe the French workman suffers less than any other, because, and especially if he is a married man, it is almost certain that he has something laid by from the wages he received in times of good trade.—*American Machinist*.

*Little Clarence*.—Pa, if a man from Portugal is a Portuguese, is his little boy a Portugosling?

## GRAND LODGE.

## Quarterly Dues Notice.

OFFICE OF THE GRAND LODGE, B. OF L. F., }  
TERRE HAUTE, IND., April 1, 1894. }

*To Members of Subordinate Lodges:*

SIRS AND BROTHERS:—Pursuant to Section 129 of the Constitution, you are hereby notified that the dues for the quarter ending July 31, 1894, (such an amount as may be determined by the several lodges, provided in no case it shall be less than five (\$5.00) dollars), are now payable, and must be paid to the Collector of your lodge on or before May 1, 1894. This amount will be in full payment of all subordinate dues and beneficiary assessments levied by the Grand Lodge for said quarter, as provided in Section 132 of the Constitution. All beneficiary members now enrolled and all those admitted prior to June 1, 1894, are liable for the full amount of quarterly dues for said quarter. All members initiated during the months of June and July are exempt from payment of quarterly dues for said quarter, as provided in Section 129 of the Constitution. Any member failing to make payment as above provided will be expelled from the order, as per Section 130 of the Constitution, said expulsion taking effect May 2, 1894, and the Secretary is required to make due report thereof to the Grand Lodge.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## Notice to Receivers.

OFFICE OF THE GRAND LODGE, B. OF L. F., }  
TERRE HAUTE, IND., April 1, 1894. }

*To Receivers of Subordinate Lodges:*

SIRS AND BROTHERS:—You are hereby notified, as provided in Section 54 of the Constitution, that no beneficiary assessment is required for the month of April, 1894, and that therefore none has been levied for said month.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## Special Assessment Notice.

OFFICE OF THE GRAND LODGE, B. OF L. F., }  
TERRE HAUTE, IND., March 1, 1894. }

SPECIAL ASSESSMENT NO. 2, \$0.75.

*To all Subordinate Lodges:*

DEAR SIRS AND BROTHERS:—You are hereby notified that Special Assessment No. 2, amounting to seventy-five cents (\$0.75), has this day been levied by the grand lodge for the Protective Fund to be used in paying the striking firemen on the Lehigh Valley Railroad who engaged in a strike, beginning November 18th, 1893, and ending December 6th, 1893, under the laws of our order. A majority of the lodges belonging to the Brotherhood of Locomotive Firemen have voted to levy this special assessment, and the will of the majority becoming the law, this levy is made. (See Section 41, Page 16, of Constitution.) This assessment is payable by all members whose names appear on the rolls of membership on March 1st, 1894, and must be paid to the Collector on or before April 1st, 1894. Any member failing to pay the foregoing assessment within the time specified will stand expelled as provided by the laws of the order.

Collectors are required to deliver the foregoing assessment to the Receivers of their respective lodges on or before April 2nd, and Receivers are required to forward the same so as to reach the grand lodge on or before April 10th, 1894.

Collectors and Receivers are required to make collection and returns of the above assessment in all things as provided by law for the collection and returns of assessments for the beneficiary department.

Collectors will receipt for this assessment on the usual form, as no special slips have been issued.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## Notice to Secretaries.

OFFICE OF THE GRAND LODGE, B. OF L. F., }  
TERRE HAUTE, IND., April 1, 1894. }

*To Secretaries of Subordinate Lodges:*

SIRS AND BROTHERS:—Pursuant to Section 130 of the Constitution, you are required to report to the Grand Lodge as expelled all members who fail to make payment of their quarterly dues for the quarter ending July 31, 1894. The names of said members must be reported to you by the Collector of your lodge not later than May 2d, and by you reported to the Grand Lodge, in the prescribed form, immediately thereafter. Failing to report the names of expelled members as herein provided, the Grand Lodge will hold subordinate lodges liable for their assessments, as per Section 63 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## Address Wanted.

R. B. PERRY. Left Savannah, Ga., November 24d, 1893, in search of employment and has not since been heard from. Any information regarding him will be thankfully received by Mrs. J. C. Boyce, 25 Margaret street, Savannah, Ga.

OFFICE OF GRAND SECRETARY AND TREASURER,  
TERRE HAUTE, IND., March 1, 1894.

**INS AND BROTHERS:**—The following is a statement of the Beneficiary fund for the month of February,

S. H. MOORE & Co., publishers of "Ladies' World," appear again in our advertising pages with another splendid premium offer. It will surely pay our lady readers to read it, as it affords an opportunity to get 200 varieties of flower seeds free with a three months subscription. We have dealt with this firm for several years, and know them to be reliable.

CHUMLEY—"How the mischief did you come to marry that old widow? Why didn't you marry the daughter?"

Benedict:—I thought over the matter carefully. If I had married the daughter, I'd have had the mother on my hands, anyhow. Then I'd have had both on my hands, but as it is, now that her mother is provided for, very likely somebody else will marry the daughter, and then I'll only have one of them to provide for."—*Texas Siftings*.

CHARLIE—"Oh, I'm dreadfully hungry! I believe I could eat my own head."

Clara—"If you're so hungry, I should think you would want something substantial."—*Truth.*

EDITOR—"We can't print these jokes. They've every one of them appeared in Punch." Wagg—"Well, what of that? Do you realize what a financial success Punch has turned out to be?"

"POOR Bostone is dead." "So I've heard." "I've been asked to write a line for his gravestone." "Going to do it?" "Yes. How do you like this: 'He never used the word pants.'"

TEACHER.—Now, Tommy, tell me who first discovered the whalebone.

Tommy.—Jonah.—*Harper's Young People.*

FRIEND—"Well, Tommy, now that you've started to school, what do you like best?"

Tommy—"Recess."

# IMPORTANT.

In view of the present uncertainty of business, we have decided to offer the two works of Professor N. Hawkins upon easy and liberal terms of payment to the patrons of the FIREMEN'S MAGAZINE and others, who will furnish a reference as to reliability, i. e., part of the cost with the order when the books will be sent, and balance monthly.

It is a proverb that "he stands strongest who stands on his head"—this has been well illustrated in the case of the owner of these two books. In the numerous changes which have taken place in the past half year, and which are still going on, the practical knowledge which has been acquired from the Hawkins works has enabled many of their possessors to hold over in good positions where others have been forced to resign.

The "Hand-book of Calculations" (now selling in its seventh thousand), and the "Maxims and Instructions for the Boiler Room" (now selling in its third thousand), are educational works of the rarest value, and have already, in scores and hundreds of instances, proved the stepping-stone for permanent advancement (Firemen to be Engineers, Engineers to be Superintendents, etc.).

The "Calculations" teaches first, the principles on which steam-engineering is founded, i. e., mechanical philosophy, and beginning with the figure one, proceeds with rules, examples, and plain directions to the most essential problems relating to steam-engineering.

The "Maxims and Instructions" teaches how to "fire" with all kinds of fuels and the different varieties of boilers; gives details of construction and dimensions of boilers. It deals with the details and management of pipes and piping, steam-pumps, injectors, tanks, steam-heating, plumbing, etc. The book has hundreds of definitions and illustrations of appliances used in and about the boiler room.

These books are each provided with a ready reference index, which renders their hundreds of practical suggestions instantly available; hence they are works of both instruction and reference.

These two books are each strongly and handsomely bound in green cloth, with gold titles; they weigh over five pounds for the pair and are almost a library in themselves. The price is \$5.00 for the two, and \$2.50 for a single volume, post or express prepaid to any part of the world.

Parties wishing them on "part payments" will be informed of the terms upon application. Club rates also given on application. Correspondence solicited. We furnish a descriptive catalogue free.

**Theo. Audel & Co.,**  
PUBLISHERS.

Office 3. 91 Liberty St., N. Y.

P. S.—Very many Master Mechanics of railroads have bought the pair of these "noble books" and found them exactly adapted to their department of railroad service.

## 200 Varieties, FREE!

An Unparalleled Offer by an Old and Reliable Publishing House! THE LADIES' WORLD is a large 20-page, 80-column illustrated Magazine for ladies and the family circle. It is devoted to stories, poems, ladies' fancy work, home decoration, house-keeping, fashions, hygiene, juvenile reading, etiquette, etc. To introduce this charming ladies' paper into 100,000 homes where it is not already taken, we now make the following *valuable offer*: Upon receipt of only **12 Cents** in silver or stamps, we will send **The Ladies' World** for **Three Months** and to each subscriber we will also send **Choice Flower Seeds**, 200 varieties, including Pansies, Verbenas, Chrysanthemums, Aspers, Phlox Drummondii, Balsam, Cypress Vine, Stocks, Digitalis, Double Zinnia, Pinks, etc., etc. Remember twelve cents pays for the magazine three months and this entire magnificent Collection of Choice Flower Seeds, put up by a first-class Seed House and warranted fresh and reliable. No lady can afford to miss this wonderful opportunity. We guarantee every subscriber many times the value of money sent, and will refund your money and make you a present of both seeds and Magazine if you are not satisfied. Do not confound this offer with the catchpenny schemes of unscrupulous persons.

**SPECIAL OFFER!** To any lady who writes to-day, Don't put it off! Six subscriptions and six Seed Collections sent for 60 cents. To any lady sending us 12 cents for above offer, and naming the paper in which she saw this advertisement, we will send free, in addition to all the above, one packet of the celebrated **Marguerite Carnation** (half dwarf variety), the only Carnation that will bloom from seed the first season. It produces in great abundance, large, exquisitely fragrant flowers of the most brilliant hues, in the various shades of white, red, pink and variegated, fully 80 per cent. being double. Plants begin to bloom in four months after planting, and continue in great profusion until frost comes. This packet of seeds is alone worth the price charged for the entire combination.

**ANOTHER GREAT OFFER!** Upon receipt of Thirty-five Cents (five Cents four regular subscription price) we will send **The Ladies' World** for **One Year**, together with our magnificent Collection of **Choice Flower Seeds** above described, likewise one packet of the extensively advertised and popular **Marguerite Carnation**. Address: **S. H. MOORE & CO., 27 Park Place, New York.**

**B. F. JOHNSON & CO.,**  
No. 3 No. 11th St., Richmond, Va.

# DEAFNESS CANNOT BE CURED

by local applications as they cannot reach the diseased portion of the ear. There is only one way to cure deafness, and that is by constitutional remedies. Deafness is caused by an inflamed condition of the mucous lining of the Eustachian Tube. When this tube is inflamed you have a rumbling sound or imperfect hearing, and when it is entirely closed, Deafness is the result, and unless the inflammation can be taken out and this tube restored to its normal condition, hearing will be destroyed forever; nine cases out of ten are caused by catarrh, which is nothing but an inflamed condition of the mucous surfaces.

We will give One Hundred Dollars for any case of Deafness (caused by catarrh) that cannot be cured by Hall's Catarrh Cure. Send for circulars: free.

# HEROES OF PEACE!

## They are Greater Than The Heroes of War!

### AND DESERVE PRAISE.

#### How the Devoted Lives of Railroad Engineers are Beset on Every Side and How to Escape Some of the Worst Dangers.

It is a mistake to suppose that heroes only die upon the battlefield.

The daily battle of life sees more heroes, is full of more pathos, has things more terrible than the greatest struggle between the hosts of war. In the patient suffering, cheerful resignation, fidelity to duty, we behold heroes as lofty, as lovely and as worthy as any ever exhibited by the soldier.

We are here reminded that among the fighters in the battles of peace, the engineer stands forth prominently as the embodiment of the hero. We read, only the other day, of the engineer of a wrecked train mutilated and in great agony, and in intense darkness, crawling along the slippery track, lantern in hand, to warn an approaching train against danger. Such instances of devotion are innumerable, but the thoughtful recognize the spirit of heroism which is made manifest by the stories and understand how terrible is the mental and physical strain with which the railroad man has to deal.

Is it at all wonderful that with the constant jar, the irregular hours, irregular meals, the care, the responsibility, to say nothing of the labor itself, many men break down? Is it at all wonderful that they look for help which will relieve their nervous system of its cares, which will place life and health upon a sure foundation?

Hundreds of engineers and railroad men have found a remedy which is precisely suited to their needs, which will counteract the evil effects that the constant jarring and jolting has had upon their kidneys, and which will tend to keep them in health, in strength, and prolong their lives. A few of the names of those who have discovered this secret are given herewith:

Mr. A. G. Dingwall, of Salt Lake City, says: "I do not hesitate to recommend to locomotive engineers or others who may suffer from the effects of hard riding on any kind of rolling stock, Warner's Safe Cure. Have had trouble of this kind myself, and know that Warner's Safe Cure is most efficacious in its action on the kidneys. I know of other railroad men who have great faith in it for any of the inconveniences resulting from riding long distances on rough riding engines, and have always resorted to its use for cold in shoulders, back or side. I carry a bottle of it on my engine with me all the time, and my faith in its power to give relief has never yet been shaken. My advice to engineers who may occasionally be afflicted with any of the ills that arise from riding in hard riding engines is, try Warner's Safe Cure, and persevere with it, and the result will be most gratifying to you."

George F. Anderson, 624 Olive street, St. Louis, Mo., says: "I am a conductor on a Missouri street railway. Before coming to this work I was a brakeman on the Missouri Pacific R. R., and had to give up work because I had kidney trouble. I was so bad at times that I could not walk the length of the car without having to sit down and ease the pain in my back. I was obliged to give up my position and look for something that would not be so tiring. A couple of weeks after I accepted my present situation. I found that the jolting of the street cars was about as bad as the others, and my kidney trouble returned. An old conductor on the line told me to use Warner's Safe Cure. I stuck to the medicine faithfully and managed to hold my job. I have not had a day's sickness this winter."

A. Coleman, Buffalo, N. Y. (N. Y. C. & H. R. R. Engineer), declares: "Some six years ago I was afflicted with neuralgia and constant pains in my side and back. I commenced using Warner's Safe Cure. I had finished two bottles with marked improvement in my case, but kept at it until I had used over twenty bottles. I was so bad at one time that I could not bend my knee to pick up anything. I am sure that without the use of your Warner's Safe Cure I would be in my grave to-day. I can daily attend to my business on the road now, free from pain and a well man."

James M. Dundon, Fitchburg, Mass., asserts: "I have been an engineer on the Fitchburg Ry. for two years, was fireman on the same road for three years. About five years ago I was troubled with my kidneys and bladder so bad that it was almost impossible for me to urinate. I was so bad that I had to stop work a number of times. I saw Warner's Safe Cure advertised, got a bottle and commenced taking it. I continued its use and am now in perfect health."

George E. Thomas, C. E., 478 Calumet avenue, Chicago, Ill., states: "My business as civil engineer, in connection with railroad work, necessitates almost constant traveling. The result was disease of the kidneys, which gave me great trouble. The use of Warner's Safe Cure entirely cured me."

Mr. Horace A. Hamilton, of Worcester, Mass., says: "My life as a railroad engineer produced disordered liver and kidneys, constant pain in the back, etc. At times I could not void urine for forty-eight hours, and then high colored with brick dust and albuminous deposit. When all other medicines failed a few bottles of Warner's Safe Cure made me well so that now I am all right. My wife was afflicted with troubles peculiar to her sex, and Warner's Safe Cure acted like magic in restoring her to health and strength."

Such statements speak for themselves. They show that for railroad and traveling men there is nothing which so preserves the health and prolongs the life as Warner's Safe Cure. They show conclusively that what this great remedy has done for others it is able to do again, perhaps for you. Bear in mind, "there is danger in delay!"

Established 1884.

## ARTIFICIAL LIMBS.

Patent Adjustable Slip Socket.

Warranted Not to Chafe the Stump.

Largest Firm in the United States.

Received Gold Medal and Diploma at the World's Fair.

The Inner Socket, seen outside the limb in cut, is made over a plaster cast of the stump, giving an exact fit, being held permanently upon the stump by elastic fastened to lacer above, and in act of walking, moves up and down in the Outer Socket, bringing all the friction between the two sockets, instead of between the stump and the socket, as is the case in all single and wooden socket limbs. With our SLIP SOCKET the most tender and sensitive stump can be fitted and limb worn with perfect ease and comfort. Endorsed and purchased by U. S. Government. Send for our New Catalogue with Illustrations.

1 Broadway, New York. 308 Walnut St., Philadelphia  
70 Kilby St., Boston. 36 Main St., Norfolk, Va.  
1 Fenchurch Ave., London, England.

The Pocahontas Coal is acknowledged by all railroads that have used it to be the best American coal for Locomotive use. It generates steam with great rapidity, and at the same time holds the fire an unusually long time. The merits of the coal are shown by the unprecedented growth of the mines, which were not opened until 1883. Since that time the out-puts have increased over 1,200 per cent. beyond all precedent, amounting during 1892 to 3,000,000 tons. During the present year it will be at least 2,000,000 tons. We are therefore prepared to fill all orders with prompt dispatch.

### WHAT THEY SAY ABOUT OUR

ELDON, IA., Dec. 18, 1893.  
DEAR SIRS:—Please send me one of your seats for locomotive use. I find that they are the best seat for engine use that I have seen yet. I want it 24 inches long and 20 inches wide. Weight, 170 pounds. Send it C. O. D.

Yours respectfully,  
W. T. BROWN,  
Engineer C. R. I. & P. R. R.

We refer by permission to the following users: D. J. Crowley, Engineer S. F. & W. Ry., 16 Jones St., Savannah, Ga.; Jno. Horton, Engineer Grand Junction, Colo.; Wm. Malloch, Engineer G. T. Ry., Belleville, Ont.

### ALL STEEL CAB SEAT.

**ROUGH RIDING MADE EASY.** Just put this seat in the box and lay your cushion on it. Made only of finest tempered steel spiral springs, heavy band steel bottom frame, and tempered woven wire fabric. Any size or shape desired. Usual size, 18x24. Price for seat not over 24 inches long, \$2.00. Terms, C. O. D. or cash with order. Please give your weight.

MANUFACTURED ONLY BY

**SMITH & HAGGARD CO., Dept. B.**

Cor. Sacramento and Carroll Aves.,

CHICAGO, ILL.

## Galena Oil Works, Limited. FRANKLIN, PA.

### SAFETY, SPEED, ECONOMY

Are the results of the use of Galena Oils. Scientific and practical tests of the past twenty years have demonstrated the fact that Galena Oils are superior to any other oils in the market.

Galena Oils in winter stand a cold test of from ten to fifteen degrees below zero, and will not freeze in the coldest weather.

The superiority of Galena Oil is demonstrated by their exclusive use upon a large majority of the railways of this country. They are in use upon three continuous lines of railways from Boston and New York to the Pacific coast and on one to the City of Mexico, thus demonstrating their adaptability to all climates and all temperatures.

We also supply our patrons with Sibley's Perfection Valve Oil, which is in exclusive use upon a large majority of the leading railroads of the country.

## "THE DETROIT"

Lubricators No. 2 and 3 for Cylinders and Air Pumps of  
Locomotives are THE BEST.

No Variation of Feed; Oil Cannot Syphon Out.

Sight Feed Glasses not WORN AWAY by STEAM or WATER.

## A BUSINESS TRAGEDY.

BY FRANK A. MYERS.

They began the wholesale grocery business with a great flourish of trumpets and loud proclamation.

Backed by a man of unlimited resources, yet not known in the business at all, why should the new firm not blow its horn? For one thing, that was a good way to advertise, and for another it would make competitors, perhaps long in the field, tremble in their boots. And this latter was no small gratification. What need the new business care for the enmity of men pursuing the same line of business? Unlimited capital made amends for all things! Why, of course!

When the business opened up on one of the best business streets of the great city, Mr. W. V. Indigo (kind of an odd name, isn't it?), the moneyed man of the concern, was not present. Indeed, he was seldom there at any time. He did not wish to be known in the affair at all.

Mr. W. V. Indigo was a gray headed, gray moustached, clean shaved, nice appearing, well mannered man of about fifty five.

It was his son, W. V. Indigo, Jr., a presumptuous, conceited, inexperienced young blood of twenty-one, who was the ostensible member of the firm of Percy & Indigo. He was a beau, not a man of any business tact, whatever. But the establishment of the business was for the sole and single purpose of schooling the young man in commercial transactions and preparing him for the responsible duty of conducting the increasing business on a wide scale in a short time.

He took second place in the firm name because Walter Percy shouldered the whole business at the start, and became the commercial instructor of the young man. Percy had no money of his own to invest in the enterprise, nothing but his business experi-

ence, tact and nerve, and so it was understood that brains should count for purse, this time at least, and the profits be shared equally. Strange combinations are possible in this world, and are sometimes effected, and a horse and an ass may be seen traveling together upon the streets pulling the same load.

In short, Walter Percy was a nice young man, about twenty seven years old; brave, because the real battles of his life had been few, and he had not been overcome as yet by any opposition. Men who have gone down in sheer defeat a time or two are less brave—perhaps more brave, but less hasty and rash—than they were when they first began to roll the Sisyphian marble block up the hill.

This new firm, with its illimitable resources and its great credit, began with a view to do a large business and make much money while at it.

"Might as well make much as little," said Walter Percy. "While making money, make it; that is my doctrine; make lots of it. It is but little harder to do a big business than a small one. And Mr. W. V. Indigo, Sr., says to make it count while doing it, and not to stand back for the want of funds to invest. That suits me to a T. There is lots of money in this business."

And the business moved with a hum from the very start. A number of traveling men were sent forth east, west, north and south, to the cardinal points of the Union, and they secured orders in so great number that the shipping force in the house had to be increased.

The building from cellar to garret, through all the stories, was stocked and crowded with goods. It soon became a busy hive, and the hum of business was heard there from morning till night. Teams came and went, hauling away goods. And still the volume of business increased. It was very gratifying to the young men composing the

firm of Percy & Indigo to witness the great volume of business they were doing.

Standing at the stove one day, when the tide of orders was coming in so fast they could hardly fill them, young Percy said to young Indigo—one partner to the other:

"This is a real boom."

A beautiful smile of satisfaction wrinkled the corner of his moustached lip.

"Making money, ain't we?" said young Indigo, attempting to twist a few short hairs he was cultivating on his upper lip.

"We must have another bookkeeper."

"Is that so?" said young Indigo.

"Yes."

"Well."

So Benthon Libros was engaged. It was a new line of bookkeeping to him, but he was an honest well-meaning man, and that was much.

They had been in business but six months when Benthon Libros entered the office and opened the ledgers. Not having had experience in that line of bookkeeping he was directed by the senior member of the firm. Everything he did was under the direct supervision of Percy. He even caught and used Percy's methods of entering accounts and followed his system of bookkeeping to the letter. The necessity for stating this so clearly at this point will appear later on.

For the first month Libros was busy all the day drawing checks, either at the order of Percy or young Indigo, but never without a request or consent from one or the other.

And Percy kept the young typewriter girl busy all the day answering the heavy correspondence that began to roll up on their hands. Young Indigo more and more pushed the work off or away from his hands, or did it hurriedly in order that he might be free from it, and sit down, and putting his feet upon his desk, talk away precious hours to some young "friend" who "had just dropped in." It seemed after a while to make him angry to be interrupted in these composed talks by any matter of a business nature. He shoved it away from him. Percy observed this unbusiness-like disposition in his partner, but his hands were tied and he was powerless. When a man entered the office and inquired for the proprietor, young Indigo would look coldly at the fellow, and if his dress did not suit him he would answer that the proprietor was not in. Or, perhaps, without turning around in his chair to look, would inform the man that Mr. Percy had just stepped outside.

What was the difference? They had the money and were "doing a land office business from the word go. Didn't need his trade or patronage, anyhow, for he did not believe he had any money."

But let Mr. W. V. Indigo, Sr., enter the

office with his gracious and patronizing smile, and the young Indigo hopped about like his muscles were coils of springs and he could not be still. Under his father's eye he could not be quite attentive enough to those who came in to transact business. And the father, figuratively speaking, struck his breast as a king would and smiled at the aptness his smart son was manifesting for genuine business.

Among other annoying things that attend business of any kind is to be named the telephone. The "hello machine" rings in at any time, without any concern for the interruption, and suddenly and peremptorily breaks off any business that may be going forward. The imperious little wall king will brook no delays, but must be attended to instantan.

As the answering of the telephone belonged to the duties apportioned to young Indigo, just undergoing his pupillage in business, he became annoyed with it in time and set his wits to work to be rid of it and shove it off on Libros, the bookkeeper. So he had it changed from his desk to the wall at Libro's elbow, and he never again answered a telephone ring except under a violent protest. Before he had the change effected he would answer sometimes so reluctantly that his anger was open and perceived; and when he could not hear or be heard very plainly, and without asking the fellow at the other end or being asked himself what he said, he would hurl the ear-piece or receiver upon the hook with a terrible frown and an angry, snappy exclamation of some sort or other, and leave it in utter disgust.

As was said he was a beau, and he was perpetually smiling softly and "kindly" at the little, patient, meek typewriter. And she permitted it, because she was in his employ. Sometimes he would go to her, hang over her desk, or rest his chin in his hands and his elbows on her desk, and while pretending to be studying the "business" was simply "smiling" at her, "playing the agreeable," as Libros said.

One day the pretty little typewriter, whose name was Lou Parsons, approached Libros, and with an arch look and a nod toward young Indigo, who was engaged in a very animated conversation with Percy, perhaps giving him some "straight" advice about the business, she said:

"Look at Indigo and smile."

"Laying it off in savage style," smiled Libros. Neither one liked him in a way that had any of the Damon-Pythias element in it. It was not his nature to make friends. He did not need them; his father had money.

"Do you see that finger shaking at Mr. Percy?"

"It goes, like his pencil does at me sometimes, as if he was angry," said Libros.

"He makes me nervous," said Miss Lou. "He has such a pointed manner, so positive like."

"It is suggestive of his humor."

"Dictatorial and curt."

"When you ask him a question relating to his work, as I am forced to do sometimes, have you noticed that he takes it that you are criticising him and fighting him?"

"Yes," with droll lips and drawn-down brows. "He is so peremptory and bossy about here. I don't like him, that's all. But you need not go and tell him, straight off now, that I said so." She turned, laughed back over her shoulder, and going to her desk sat down, almost tossing herself into a lump in the chair. After a little bit, when her disgust had partly vanished, she evolved herself from her entanglement in a lump and proceeded with her work of touching the keys of the typewriter.

Lou Parsons was a lovely little girl.

Things went on another month or two with a rush, a hip and hurrah, and a "spreading out" in the business.

As learned from the books, not as told him by any one, Libros saw how the business was going. They transacted all their banking business at the People's national bank. There Mr. W. V. Indigo Sr., had deposited bonds as collateral for about \$50,000, all of which was used in the business.

And yet—the house sometimes overdrew its deposits as much as \$3,000! Collections were hard, and it appeared impossible to "get ahead" or keep even with their deposits. As Percy said:

"It is hard to get the balance on the right side of the check book any more."

This was the situation when Libros entered upon his work in the firm. It afterward appeared that the bank informed Mr. W. V. Indigo, Sr., of the situation at the bank and he gave his consent to it.

Even the president of the bank coolly walked into the house one day, found Percy, and held a closed door conference with him. It was a vigorous remonstrance against the overdrafts. Percy declared with all the meaning and intent of his heart:

"I promise you we shall try to get even once more, and then over drawing shall not occur any more, I promise you."

The bank president went away not fully satisfied, but hopeful that his call and "kick" would bear good fruit before long.

In the course of time a \$500 draft, drawn by an outside firm, was sent direct to Mr. W. V. Indigo, Sr., for collection. This awakened him. He came in to look into the business and to plant his objections against the payment of the debts of the house by his personal funds or deposits.

The ostensible firm looked down its nose when the man with the long pocket entered

to investigate and remonstrate and to administer advice. He wanted to know all about the books, and Libros showed him. It was also explained to the senior Indigo that the books were kept according to the instructions and orders of the senior member of the firm, Mr. Percy.

"Well, I think," interposed the gracious stormer, Mr. Indigo, Sr., "I think these books could be kept so as to show the nature of the business at the close of every day. As it is I am in the blind."

Then Libros began to comprehend where he stood in the opinion of Mr. W. V. Indigo, Sr., and what were his true relations to the firm. After he had gone, the assistant bookkeeper said:

"What is it his business about these books? Is he the firm? I don't like for an outsider to come in and put his nose into the private affairs of this concern. It's our business to guard these secrets."

"His relation to this house has been scrupulously guarded from me. What it is I have never been informed. It is a secret with them. But then we know he is the man at the back of the whole concern." So spoke Libros.

"Yes, I suppose we must secretly know this to be the fact; but it must never appear openly that we know it."

"That's it. They appear to be concealing the fact from us," said Libros rubbing his chin.

A day or two succeeding this, while hanging over the ponderous volumes on their counting-house desk, the assistant bookkeeper suddenly looked up at Libros with a confidential spirit in his eyes and said:

"I'm tired of this hard job and everlasting day-and-night work. From the time we open our eyes in the morning till we close them late at night we are buried here over these confounded old ledgers, scarcely time to eat a little snack and no time at all to speak a word to a friend. Why, what is life, anyway, carried on this way? I don't like the job one bit."

"It is tough I confess," said Libros musingly.

"Tough! I should snigger to smile! Why they would not work a hoss as many hours as they work us—would have some pity on the poor brute, but us poor humans—O, well, we don't need any sympathy or rest. We are not as good as his hoes—his brute. I don't like it one little bit. I don't believe you do, either, though you are wiser and keep your mouth shut. I confess to a little running off at the mouth." He had a fashion of rubbing his mouth with his palm, and drawing a long breath through his nose when ruffled a little in the quiet precincts of his inner heart.

"It's hard; but then we will get caught

up after a while, and then it will be easier. You see when we took hold here things were terribly behind."

"I never saw things worse, did you?" said the assistant young bookkeeper a very nice and agreeable gentleman.

"Never in the world," said Libros, taking nips at his nose with his thumb and index finger. There was black ink all over his middle finger, and a streak on his right cheek where the pen had accidentally touched it as he put the holder behind his ear. There was a scratch of red ink on the back of his left hand—true marks of the character of his work.

"Perhaps I would be better satisfied if I knew just what our weekly wages were going to be," said the assistant. "Here we work all week, take out of the drawer at the end a little money, and leave the balance to draw in a lump when we make a settlement. It is a saving up, but how much is it, that's what I want to know."

"It would be more satisfactory if we knew."

"Of course it would, and more business-like also. I spoke to Percy about it and told him we would like it better if we knew just what we were going to get."

"And what did he say?"

"He said, that's so, and he would talk with his partner and see about it."

"They are honorable men, all honorable men, and will deal justly with us. I'm not afraid to trust them. Mr. W. V. Indigo, Sr., is the soul of honor itself." Libros fully believed this, for he said he knew the men he was working for.

"That may be, but it would be better all around if we knew just what we are going to get."

"I believe if we do not agitate this matter at all, but work on humbly and faithfully and trustfully they will do better by us in the end than they would if we stir this thing too much and provoke them about it with over persistence," said Libros. "Besides they are honorable men, and if we go quietly on trusting it all to them they will appreciate the delicate compliment and reward us liberally for it in the end. They are honorable men, and will not, cannot, mistreat us."

"I believe I would be satisfied with less money, if they would name definitely the sum we are to get." The assistant bookkeeper reluctantly dipped his pen in the ink and began posting from the journal to the ledger-folio.

With heavy head, sometimes a blinding headache, Libros went on with his onerous burdens. It was toil, toil, day and night, though he was sick yet he was faithful and ever at his post. Sometimes he did not reach his couch till two o'clock in the morning. And yet that same morning bright and early

he was in his place and bending over his folios in the interest of the firm. He was doing his part fully relying on the honor of the men for whom he toiled.

At the end of about ten months the rumor became current on the street that the house had failed, or was about to "go under," and over and over Libros was obliged, much to his distaste, to inform the eager questioners whom he chanced to meet on the street that there was nothing at all in the rumor.

"Do you think they will fail?" asked the assistant bookkeeper one day of Libros.

"No—they can't. They are honorable men, and the Mr. W. V. Indigo, Sr., is good for all their liabilities."

"They are getting terribly behind," said the assistant laying his head down confidentially upon the counting-house desk for a minute. "If they have all that money to pay at the bank, and the income now not sufficient to meet current expenses—somebody's going to lose big money."

"They are running behind continually, that is a fact," said Libros.

"Why is it? Is it in the management or what?"

"Both," smiled Libros. "Between me and you and the gate-post they cannot run much longer."

"Is that your private opinion publicly expressed?"

"My private opinion privately expressed."

After a minute the assistant said:

"O, any one can see with half an eye. They must wind up soon. They can't stand this continual falling behind. They are in the decline now, and the fall is sure to follow—sure as guns. Why, Percy is selling some things at less than cost. The traveling men always sell at the lowest figure he gives them, to be sure in order to underbid all competition. They make some bad deals, and then they lose from bad customers. These perishable goods reach their destination often in a bad condition. Then they are returned and freight paid on the worthless stuff both ways—dead loss. The traveling men make allowances for poor goods, and cut out all the profits. Skinfint dealers defraud them, because they can and because the middleman wants to hold their trade. O, pshaw! they are bound to fail—can't help it."

"I think they will close out soon. Mr. W. V. Indigo, Sr., is sick—living on milk diet. He's worried, that is all. Percy looks like he saw the devil in his dark bed room every night. Why? The senior Indigo is worrying the life out of him, don't you see."

"Is that why they are trying to get this 'statement' out for him—to show up the condition of the business—is that it? I never thought before. Why, of course that is it. I begin to see."

"That five-hundred-dollar draft the silent partner had to pay the other day was the exploded bomb in the camp," said Libros.

"Here they keep us working till midnight every night on this statement, and it's for his sake!" exclaimed the assistant as they hurried along the street toward their homes for supper.

"They cannot fault us for not being faithful," said Libros.

"No sir. But will they pay us for it?"

"I have faith—implicit faith—in their Christian honor. They are all leading members in the church," said Libros honestly.

One day Percy came in and said to the assistant bookkeeper, much against his will, but forced to do it by the senior Mr. Indigo:

"We must cut down expenses. We have not made as much money the first year as we expected, and we will have to let you go. We like you, and wish we could keep you, but we can't. We are using Mr. Indigo's money, and he orders retrenchment—retrenchment."

When the assistant was paid, he was perfectly satisfied with his wages. This generous act made Libros feel better.

"I told you so," he said as he bade his assistant good bye.

In a day or two Percy said to Libros:

"Mr. Indigo, Sr., has secured an expert bookkeeper, who will come in here shortly and take charge of these books. I must be relieved of all this office work."

Libros was stunned, numb. Percy gazed curiously, with his elbows on the end of the desk, to note the effect on Libros.

"We do not doubt you in the least," he added, "but I cannot give my time to so many things. If I do something is sure to be—bound to be—neglected."

The same day young Indigo, with a shamefaced look, asked the key to the money drawer from Libros. It *did* look like they suspected him. But no, they knew better. They were simply automatons doing the absent Indigo's orders.

After a few minutes a bill came in for payment. Pulling down the checkbook young Indigo said pompously:

"I guess I may give a check for that."

Heretofore he could not think of writing a check. Libros was employed for that purpose. He even had to be coached and waited on for his signature to the check after it was written. But the stern demands of a father make a difference.

In a short time Mr. Indigo, Sr., walked into the office. The mild-mannered man now had a brusk, stern, hateful air about him, and Libros wished he himself out of the impending crisis he clearly foresaw for some time. Mr. Indigo, Sr., was nervous. Young Indigo, file, was utterly submissive.

But the father was as gentle to him as the course of a wind-wafted feather in the air. This gentleness did not "gee" with the son's cringing submissiveness, somehow.

Now he earnestly showed Libros how to balance the checkbook; said that when he was in business he would not accept the key to the cash drawer; averred that he would not put his signature to a check till he saw that the balance was on the right side at the bank; and then with most sternly knit brows and excited eyes commanded Libros:

"I want you to understand that no check is to be drawn here without *my* authority."

Then he snatched the pen from Libro's fingers and demonstrated on the checkbook how he wanted it balanced.

"That's the way I used to do it when I was in business."

"But, my dear sir, you seem to forget," said Libros calmly but uneasily, "that I might draw all the checks in this book, and even sign them, but they would be worthless at the bank. They require Mr. Percy's or your son's signature. It's not the drawing of the check that's wrong, but the signing of it. Besides, sir, I never draw a check here unless ordered. But, your wishes, sir, shall be respected."

"I never saw such bookkeeping. I do not know who is responsible," he added bluntly.

"Every man has his own ways of doing things. I have done this according to orders."

"Humph!" sarcastically. "Get at your collections. Get in all the money you can."

A drowning man will catch at a straw. Libros saw that he was going to be made a scape goat. He was a poor man, and could not afford to be independent. He needed every cent of money he could get to live on. God knows how he struggled with poverty. And here he was damned for doing his duty. That is the way things often go in this world. The good are made to appear as the baggage and worthless and wicked. Libros felt he had been misrepresented to the Mr. Indigo, Sr., but he could not help it now.

He trembled for his wages. No doubt if they had prospered they would have paid him liberally for all his hard labor. But how now? He felt that he would be the heaviest loser of all, and the one the least able to afford it.

Goodness! how that man Percy worried day after day. His eyes grew "starey" and large and glassy. He was deposed from the management of the business and put over the city department. He was drifting away and losing interest in the concern. What pain was not to beset on his brow and face! What did he not suffer!

He would involuntarily clasp his forehead with his palm, and then jerk it away as if he were tearing something out.

"Only a bad headache!" he would say and go off whistling merely as a matter of show to others.

Then he became too weary to attend church on Sunday. Things grew worse and worse. There was no relief. But through it all, he had one sweet satisfaction. In the darkest hour of his adversity his faithful wife bent over his drooping head and whispered kind, consoling, trustful words in his ear.

At length the People's national bank refused to receive their checks. Then the end was not for off.

The expert bookkeeper came. He was a perfect gentleman. For two or three weeks Libros remained to assist him in taking hold of things and "familiarizing himself with the lay of the business," as he said.

"I was employed here," said Herman Balsam, the expert accountant to Libros one day, by old man Indigo, and he told me that Percy was doing the bookkeeping. If I had known that I was displacing anyone, I would not have come in here."

The new bookkeeper was treated as good as pie by both Percy and Indigo, Jr., but Libros was scarcely to be spoken to as a man any longer. That is the way of the world, you know.

"I do not like to take hold of a declining business," said Balsam to Libros. "A kookkeeper has an awful amount on his mind. It is a hard life."

Young Indigo gave Balsam the money-drawer key, and told him the combination of the safe. Libros was now entirely deposed. He felt it keenly. Balsam wrote the checks at his own pleasure. It began to dawn on Libros just to what extent he had been misrepresented to Indigo, Sr. Many whispers were exchanged that Libros knew not of. And when he caught them whispering they would stand abstractly, look blank, open a book, and then separate.

When Indigo, senior, entered Balsam said:

"We are trying to balance this check-book. It seems to be too much overdrawn."

Mr. Indigo smiled. That was all. Percy said:

"There are lots of drafts not credited up, that is the reason."

This fell like a revelation on Libro's ears. He saw then that he had been misrepresented and made to appear as the sole cause of the failure. All the sins of mismanagement were piled on this scapegoat.

Of course Percy meant to say it was Libros' fault that the drafts were not credi-

ted up. That small sin piled on him meant all the larger ones also.

The truth is that Percy himself would go to the bank and there write a check and never report it; would a month afterward pull a well-worn freight-bill or receipt out of his pocket that Libro had hunted for long without avail; would pay out money and forget to whom he paid it; would receive and receipt for money and forget who paid him; and other like unbusiness-like methods.

"These are *young men*, merely *boys*," said Balsam to Libros referring to the original firm, "and it is no wonder they are failing. Experience was lacking. Then they reached out too much. Percy could not compass such a business. It's all plain."

All in one day the drummers and Libros "went"—were dismissed. Neither of the original members of the firm were manly enough to be in at the collapse, and Balsam had the disagreeable duty to perform of winding up the business. The typewriter, Miss Lou Parsons, as she walked away with Libros, said:

"Percy is sick. I guess it was because of the way that awfully mean man, Mr. W. V. Indigo, senior, talked to him. O, my! They say he talked scandalously—awful—to him."

"I pity Percy," said Libros. "This is a slam on him. He will never get rid of it. It will follow him into other places, and hurt him. It is a bad recommendation."

"Now, if it would only hurt young Indigo—I'd like that. Aint he stuck up?" asked Miss Lou with a dash of scorn in her query.

"And he was sweet on you."

"No—h-h-h! Me! No—h-h-h!" she sneered.

"Oh, that was a dead-open shet, as the boy says—plain to be seen, and denial removes no fact. Your blush tells what you think, too," added Libros.

"Come, now, none of your nonsense," she said in a most lively strain, tripping along at his side, oblivious of the streaming multitude in the street. "But what do you think of the failure?"

"Big thing. Old Indigo lost heavily."

"About how much?"

"About fifty thousand dollars."

"He paid dear for his son's business education." She laughed a rollicking laugh.

As they paused on the corner a moment before separating Libros asked:

"Have you got your wages?"

"Have! They don't get ahead of me. I kept right up with them. Have you?"

"No. And I expect to have a time getting it out of them," answered Libros bending his eyes intently but abstractly far down the bustling, throbbing street.

"If they had prospered no doubt they

would have paid you liberally, but since they failed they will cut and retrench on all sides—wherever they can.”

Libros feared this was too true. All men are honorable men—till they lose money. The two parted.

Day after day for more than a month Libros called for his money, but the expert bookkeeper, perhaps under orders, first with one and then another tergiversation, put off a final settlement. They owed the poor, faithful, hard-worked fellow about one hundred dollars back wages. The various little excuses and subterfuges, some of them so palpably thin as to reveal a glimpse through at the prompting cause, finally made Libros fear that it was a settled plan not to close his account at all.

At last all the employes were dismissed, and no one was seen at the once busy bustling house but Herman Balsam, the expert bookkeeper. After a few days poor Percy was sent adrift, empty handed, penniless, and groaning with anguish and regret. He was virtually driven away—driven into sorrow and want—driven into the black night of shame and pain. His sweet, little, faithful wife took it so to heart that she sickened. Poor Percy hung over her with a bursting heart but it would not save her. A little new child was left in his care, but the dear, loving young mother was in heaven. A hard man's money murdered her. Ah, what misery and suffering “cold cash” is the bloodless parent of in this harsh, uncompromising, civilized age! What—what could replace that fond, noble wife to Percy?

The next step was the assignment of the firm of Percy & Indigo to Mr.—Mr.—W. V. Indigo, Sr., the preferred creditor, the man whose certified check was good anywhere in the city. The assets did not pay the liabilities to him by half.

“Good-bye, wages!” exclaimed Libros when he heard of the assignment, or mortgage made in the interest of Mr. Indigo, the man of singular financial resources.

Now he sought Mr. Indigo, senior, to have a talk with him. That gentleman, cold blooded and imperious, sat in his luxurious office. He barely recognized Libros—too busy. But don't you suppose he knew? of course he did.

“Mr. Indigo,” began Libros, standing, not even shown the courtesy of an invitation to a seat that stood at his knees. Mr. Indigo wheeled around quickly in his chair, a scowl on his face which was meant to intimidate. But it did not. Indeed he himself saw in the face of Libros what he did not like.

“Well!” curtly—sourly.

“I've come to demand my wages.”

“Do you suppose,” with a flash of the eye, “do you suppose I'm going to reach

down and pay you more, after all my heavy losses in this unfortunate business. Not much.”

“Is that your ultimatum?”

“It is,” sharply. Both men were strung up.

“Then here's mine. You cut my wages, when you paid all the others liberally, because, as Percy once said, you meant to keep me permanently. Ye gods what a reason! You are a robber, sir, You rob me, me who is poor and cannot afford to lose a cent—rob me to pay yourself, you who are rich and able to lose it. Is that manly? Is that justice? You reverse the old rule of the robbers who robbed the rich and paid the poor—you rob the poor to pay yourself. But you are an honorable Christian! Yes! Borrowed the livery of heaven in which to serve the devil. You have not only robbed me of money, but of time which you had no right to. But you are an honorable man! Yes! You accepted my services, day and night, and now will not pay me what you owe me. But you are an honorable man! Yes! You can steal from me the last cent I have in the world—keep back my fairly and hardly-earned wages—and that is right (in your poor selfish eyes) but if I should steal a hundred dollars from you you would put me in jail, and if I took all you had in this world and left you with not enough to buy bread you would try to hound me to death. That's what you have done to me—robbed me of my last cent. But you are an honorable man. Yes! Now just wait—I've not done yet. You have euchered me out of my earnings, you have treated me as a scullion, you have acted like an unprincipled, soul hardened, money-cursed wretch, you have taken the bread from the mouths of my family, you have treated me like a dog! But you are an honorable man! Yes! You have deprived me of many things I had calculated on by the use of that money, you have cheated me out of many little pleasures it would have brought me, you have defrauded me of my just rights, you have played the robber and the hypocrite, you have acted the lord and master and will still do it while I must suffer that you may have what does not belong to you. But you are an honorable man! Yes! The Good Book says ‘Thou shalt not defraud thy neighbor, neither rob him: the wages of him that is hired shall not abide with thee all night until the morning.’ But you are an honorable man! Yes!”

All this time Mr. Indigo, Sr., acted fidgety and looked nervously around, drew long breaths, got up from his chair, sat down again, looked around for his hat, turned to gaze out the window, reached out here and there and took up and laid down a multitude of letters and papers on his desk,

walked away and turned back, but through it all he had to go. There was that in Libros' eye that held him there. He was afraid to remain and afraid to go away.

"Is that all?" he inquired, ironically, when Libros paused.

"Are you so far sunk below decency and human sympathy that all this seems as nothing to you?" added Libros with a sneer and an evil glance. "I have not told you what I think of you, nor what you are. I will forbear. But what are you in my opinion? I do not suppose you care for my opinion. I am too insignificant to have an opinion that has any weight with you—as you think. We shall see. You are a miserable, cowardly, dirty, thieving dog!"

Libros shook his fist at the trembling thief. He dared not resent it. His interlocutor was in the humor to get satisfaction out of him.

"That's my blessing," said Libros, as he moved out of the door, "and you are welcome to it."

Poor Libros never got his hard-earned wages. That is the way with some employers; not content with receiving the lion's share of the earnings of the poor, faithful, oppressed wage-earner, they filch from them their little trusted savings when the slightest opportunity presents itself.

This business tragedy really fell heavily on our good, faithful friend, Benthon Libros. His account was criss-crossed.

## THE AMERICAN FARMER'S STRUGGLE FOR BREAD.

BY WILFRED P. BORLAND

When Henry A. Robinson, the present statistician of the Agricultural Department, entered on the duties of his office, about one year ago, a government inquiry was begun under his direction and management for the purpose of securing official information that would render it possible to return an answer to the question so often propounded as to what it actually costs a farmer to raise a bushel of wheat or corn. This inquiry has just been completed, and the results based upon it, which are simply astounding, are now in the hands of the public printer, to form a part of a regular bulletin to be issued shortly by the agricultural department. For the statements of fact embodied in this article I am indebted to the Washington correspondent of the *Detroit News*, who sends them to his paper, as having been obtained from Mr. Robinson, personally, in advance of their official publication. Every precaution was taken to obtain accuracy in the results, and Mr. Robinson's enviable reputation as a painstaking statistician is an earnest of their reliability, notwithstanding their really startling economic significance. Every acre of wheat in the country, according to the

inquiry, is grown at an average cost of \$11.69. Figured at the average price which he got at the farm, 53.8 cents a bushel, without railroad transportation to the great wheat markets of the country added, the farmer received for the wheat grown on each acre of land in 1893 the sum of \$6.16. This shows an average loss for each acre of wheat planted of \$5.53. The total acreage of wheat in the country in 1893 was 34,620,418 acres. At an average loss of \$5.53 per acre, the total loss to the farmers of the country in growing wheat last year was \$191,500,681.54. The average cost of growing each acre of corn is \$11.71. At the average price for each bushel of corn at the farm, 36.6 cents, the farmer received for each acre planted to corn in 1893 \$8.21. As the cost of growing it was \$11.71 per acre the farmer's loss on each acre of corn grown was \$3.50. The total acreage in corn in 1893 was 72,036,465 acres, so that the farmer's total loss on growing corn last year was \$252,127,627.50, and on the two items of wheat and corn the total loss was \$443,628,309.04, or nearly half a billion dollars. Is it any wonder that there is intense unrest among the farmers of the country when they have such a condition as this to grapple with? The total wheat crop for 1893 was 396,131,725 bushels, a falling off of about three millions bushels as compared with 1892. The average yield per acre was 11.4 bushels. If it costs \$11.69 to raise 11.4 bushels of wheat, then it cost \$1.02½ to raise one bushel. Wheat is now selling in Chicago at an average price of about 57 cents a bushel. The average price received for the wheat crop, at the farm, in 1893 was \$6.16 per acre, or about 54 cents a bushel, thus showing an actual loss of 48.5 cents on each bushel raised in the country in 1893. The price received per acre in 1892 was \$8.35; in 1891, \$12.86, and in 1890, \$9.28. Only once since 1883 has the price received been higher than the actual cost of raising, and that was in 1891. The average price received from 1879 to 1889 was \$9.97 per acre. The total crop of corn in 1893 was 1,619,496,131 bushels. The average yield per acre was 22.5 bushels, making the average cost per bushel about 52 cents, at a cost per acre of \$11.71. At the price received per acre at the farm, \$8.21, the farmer suffered a loss of about 16 cents on every bushel of corn grown in 1893. Corn is now selling in Chicago for about 37 cents a bushel. The average price per acre received for the corn crop in 1892 was \$9.09; in 1891, \$10.98, and in 1890, \$10.48. The average for ten years, from 1879 to 1889, was \$9.48 per acre. Nine items are given as entering into the cost of raising wheat. These items for sixteen states, as well as the general average for the whole country, are presented in the following table:

COST OF WHEAT PER ACRE AND AVERAGE ITEMS ENTERING INTO COST.

STATES.	Rent of ground.	Fertilizers.	Preparing ground, (plowing, harrowing, etc.)	Seed.	Sowing.	Harvesting.	Threshing.	"Housing,"	Marketing.	Total cost.
Michigan	\$3.05	\$2.86	\$2.73	\$1.21	.35	\$1.36	\$1.11	.34	.82	\$13.83
Maine	3.43	4.96	3.39	2.30	.44	2.21	2.28	.79	\$1.21	21.01
Vermont	3.51	3.78	3.17	2.09	.51	2.24	1.80	.68	1.24	19.02
Massachusetts	4.08	5.43	3.83	1.80	.72	2.58	2.63	.96	1.79	23.82
Connecticut	5.31	4.81	4.09	1.50	.51	2.83	2.72	.83	2.74	26.34
New York	4.56	5.36	3.01	1.64	.49	1.47	1.44	.60	.92	19.52
Virginia	2.54	2.83	1.92	1.03	.47	.93	.93	.30	.92	11.87
Georgia	2.44	2.13	1.28	.94	.37	.74	.88	.30	.67	9.75
Ohio	3.72	3.08	2.46	1.08	.45	1.29	1.35	.46	.73	13.62
Indiana	3.65	2.02	2.03	.91	.40	1.13	1.33	.38	.64	12.39
Illinois	3.68	1.76	1.58	.96	.29	1.13	1.23	.28	.54	11.45
Wisconsin	2.91	3.09	1.88	1.19	.38	1.15	1.11	.36	.85	12.93
Minnesota	2.66	2.35	1.65	.97	.38	1.22	1.02	.28	.61	10.74
South Dakota	1.52	1.42	1.55	.82	.31	1.12	.97	.25	.61	8.57
North Dakota	1.63	1.49	1.69	1.32	.42	1.00	1.42	.31	.75	9.62
California	3.17	2.38	1.96	1.08	.31	1.40	1.35	.54	1.32	13.51
Average for whole country	\$2.80	\$2.16	\$1.87	.99	.37	\$1.19	\$1.19	.36	.76	\$11.69
Expert average for whole country	\$2.75	\$2.34	\$1.85	.87	.35	\$1.17	\$1.13	.33	.69	\$11.48

In explanation of the items classified as expert average, which appear in this table, it may be well to state the method by which the figures were obtained. The first step taken in the investigation was to send out thousands and tens of thousands of preliminary circulars to the correspondents of the bureau and to practical farmers in every section of the country. The reliability of the final average struck must, of course, depend on the reliability of the individual estimates, and the importance of accuracy at every stage of their computation was strongly impressed on those who undertook to figure on the different items entering into the cost of their crops. All last summer thousands of farmers located in every one of the 2,800 counties of the United States in which wheat or corn is raised kept a watch on things, made memoranda as to cost, and held long conferences with intelligent farmer neighbors. There were 25,099 different practical farmers who sent in reports to the department on the cost of raising wheat, these individual reports often representing the average cost for a whole neighborhood. These individual reports were then classified and averaged, under the direction of Mr. Robinson, and the results as shown in the table obtained. Rent of land, or interest on money invested in land, is the most considerable item, being an average of \$2.80 for the entire country. This item shows a great increase in the eastern states, and because of the comparatively small acreage in those states other items also show a great proportionate in-

crease. The item, housing, includes shrinkage, waste, etc. For greater accuracy the department sent to all the agricultural colleges of the country to secure individual estimates from trained scientific observers. They also got the names of such graduates of agricultural colleges as had engaged in farming, and solicited returns from them also. These expert estimates were secured for comparison, from a little over 4,000 individuals, and were averaged separately. The closeness with which the different items in these averages approach to the figures obtained from the 25,000 practical farmers, makes the department very confident of the general reliability of their estimate as a whole. As will be noticed, the experts' estimate of total cost per acre, averaged for the whole country, is \$11.48, as against \$11.69, the figure shown by the other set of returns, a variance of only 21 cents per acre. The greatest difference between the averages of the two sets of reports is on the item as to the cost of fertilizers, the experts' estimate on this item averaging 18 cents per acre higher, and this is what might be expected from the scientific training they have received, their knowledge of the imperative needs of the soil, etc. On rent of land there is only 5 cents variance; on preparing ground, only 2 cents; on sowing, 2 cents; on harvesting, 2 cents; on threshing, 6 cents; on housing, 3 cents, and on marketing, 7 cents, the experts being the lower on all these items. In the matter of cost of seed per acre there is a variance of 12 cents per acre shown in

favor of the experts, and this, again, is what we might expect from their scientific training, leading them to practice the higher economy in seedling. The average amount of seed wheat planted per acre for the whole country was 1.4 bushels.

Other evidence supporting the reliability of the figures can be discerned by a study of the table. For instance, states lying in the same general section of the country show little difference in the averages of cost although, of course, the averages are based on entirely different sets of returns. In Michigan the total average cost per acre is \$13.83, and in Ohio \$13.62; in Indiana, \$12.39, and in Wisconsin \$12.93; in Maine \$21.01, and in Vermont \$19.02. In South Dakota, where the cost per acre is lowest, there is still an average loss to the farmer of \$2.41 per acre. One might be excused for expecting to find at least one section of the country where the farmers' account with king wheat and king corn would show a balance on the proper side of the ledger, but such is not the case. The story of absolute loss to the farmer is invariable; there is nowhere a rift in the clouds.

With respect to the corn crop, there is even less difference between the expert and the practical farmer's averages than is shown in the case of wheat. The expert average for the whole country being \$11.57, as against \$11.71 for the practical farmer's average, a difference of only 14 cents per acre. The same general conditions of variance may be observed here as in the case of wheat. Kansas is the state where corn is raised at the lowest cost per acre, but the Kansas farmer is still raising corn at a cost per acre 39 cents in excess of the average price received for it, the average cost for the state being given as \$8.60 per acre. Eight items enter into the cost of raising corn, and the averages are obtained from the reports of over 28,000 practical farmers and 5,000 experts.

There is a great deal of food for thought in these figures; they have truly remarkable economic significance, and should set farmers to thinking, and acting, as they have never done before. The apparent loss of nearly half a billion dollars does not, of course, mean that that amount of cash was actually taken out of the accumulations of the farmers of the country. The use of the land and the labor in growing the crops are the two biggest items in the cost per acre of the two grains. If every farmer in the country lived on a rented farm and hired all his work done at ruling prices, the aggregate, actual out-of-pocket loss would be the nearly half billion dollars which the figures quoted show. What the figures really mean is that the farmer who owns his own land and does most of his own work received a little more than his actual outlay after

his corn and wheat were sold, but he got no interest on the money invested in his farm and the wages he received for his uncommonly laborious toil were not above those paid to the miserable ryots of India, or the fellahs of Egypt. With relation to his work, the average farmer is both employer and employee. He does his own work and as a laborer, working for himself as employer, he actually gets not half the wages of the lowest paid laborers in the country. He is a slave to his environment, as truly as the poorest paid laborer struggling in the grasp of the capitalists of the country, and he enjoys scarcely the advantages of slaves. Agriculture is the basis of life, both individual and national. When the farmers are prosperous and contented all other classes of the population of a country are in a like condition, and the decline of its agricultural population always marks the decline of a nation, in all the essentials of a sound, healthy national life. There is no fact more prominently written on all the pages of history than that. One of the conspicuous facts of the agricultural statistics of the last census is that the number of tenant farmers, and the consolidation of ownership of agricultural land, in this country is increasing at a rapid rate. One of the conspicuous facts that marked the decline preceding the dissolution of the great empire of Rome was the decay of the class of free, independent landed proprietors and the increase in the numbers of the coloni, accompanied by the growth of the *latifundia* to which Pliny ascribed the ruin of Italy.

History is but repeating itself. The free, independent American farmer is fast disappearing, and unless there speedily comes a radical change for the better in present economic conditions we may soon write *finis* on the last page of the history of the great American republic, for it has entered upon its period of decay and is already well on the road to its dissolution. Whatever conclusion one may come to after a study of these figures, there is one fact that stands out clear and distinct, namely, the working farmer's interests as a land user are greater than his interests as a land owner, and any measure tending to free the use of land and diversify occupancy is for his benefit. He must be freed from the grasp of the capitalist usurer and the political speculator, and that can only be done by, in the instance, freeing the land. The farmer must forego the vain effort to protect his interests as a land owner, and devote his attention to the protection of his interests as a land user. There lies the way. The interests of the farmer and the laborer are mutual: they must affiliate, and unite their forces in defense of a free American citizenship and against capitalism.

## CIVILIZATION'S GRAND BATTLE.

BY JOSÉ GROU.

We are not in favor of military battles, or any other implying violence in any form. Brute force has always been the greatest curse of the human family. It was never intended that human progress should thrive through mere exhibitions of animal power, involving destruction and pain here, with vainglory there, and negative results everywhere. Because although it is true that the race has experienced a certain degree of progress, in spite of the senseless struggles for mastery among nations and classes, in this or that line; yet the progress in question has been saturated with crimes and despair, with the wisdom that some how or other perpetuates ignorance by wholesale, with that goodness among some which seems to be forever localized in small groups and lacks power of diffusion.

Can we have any great respect for progress in the midst of deformities? That may be, of course, progress after the manner of men, all because evolved through exhibitions of brute force, through battles, in which violence is the principal element, and selfishness the final aim.

Nooner or later we must try to have battles of a different kind, evolving a different form of progress, which eliminates all crime, all despair, all selfishness, and builds up the real healthy nation through the round man and the symmetric citizen. No other kind of progress will ever do. Every other kind is a naked farce, a blasphemy, a lie, good enough to brag about, and good for nothing else.

The emptiness of our boasted progress is perhaps most emphatically noticed when we talk with people from whom we have the right to expect sound conceptions of life. In order to illustrate our meaning we shall refer to a conversation we had a little over one year ago with one of the most eminent generals yet alive, eminent not only for his important services in our late war, but also on account of his high personal character, his culture, and all that combination of traits which makes a man extremely charming to whoever may come in contact with him. Well, the only great danger to our nation that that choice gentleman could see was—the machinations of the Jesuits! And there is nothing of the religious bigot in that old fine general, and in many respects a choice man, a high human type.

That this nation of ours, with our immense resources, large population, and so on and so on, that we should be in danger of shipwreck from a secret conspiracy on the part of, say 3,000 poor priests, called Jesuits, scattered through our 3,000,000

square miles! How ludicrous! When we tried to call the attention of our general to the lamentable ignorance of most of our voters, handled like sheep by groups of politicians, then the general recognized, what? Not much. Only the need that every citizen should be well posted up about the excellence of our constitution, so that to obey its requirements.

Well, well, our poor general had never yet realized that all the disasters of this nation of ours arise from legislative acts enacted in obedience to our constitution. With all his deep religious convictions our general did not even suspect that what our citizens need, what we all need, is to obey, and so to be well posted up about God's constitution in the universe, about that eternal moral law which would remain a fixed, tangible fact, and worthy of all respect, even if there was no God anywhere! And that general simply stated what most people in high position will tell you. The idea that our constitution should not be in perfect accord with all moral and ethical law! Perish the thought. When pushed hard, our friends of high degree may acknowledge that the perversity of some men makes it impossible for us, the good fellows, to make better laws or a better constitution.

There you have it anyhow, an empty civilization, incapable of raising men up to any level compatible with the laws of God or of nature. Choose whichever set you like. You will find it mighty difficult to trace a dividing line. Yes, an empty civilization, which piles up all the goodness in a small group, and leaves the rest to forever struggle with evil. A civilization unable to specialize natural laws, the only ones worthy of respect, worthy of free men, the ones alone through which we can ever learn how to live in peace with each other.

Apparently, it has never occurred to our good men that any such specialization was needed, or was possible. And why so? Because, as stated above, our progress has constantly proceeded along lines of violence and brute force, through battles for selfish purposes, for greedy aims, for exclusivism in all forms, religious, civil, political, industrial. Even sex exclusivism rules supreme as yet, since we keep denying to the mothers of our boys the right to say which laws shall preside over the fabric of civilization.

Look now at the object of the first historical battle of which we have any records, between Cain and Abel. The former was jealous of the latter because he was promising his flocks without having asked permission to the first comer, the top man, the elder brother. We all know what the top man did to assert his rights over the land. Cain was the first land monopolist.

All the other battles that for sixty centuries, more or less, have soaked the earth with human blood and human tears, the latter are sometimes more painful than the former, they all have been fought for the same purpose, viz: To assert the rights of some to the possession of the earth, at the expense of the rest. To see that the first comer, or the top man, dead or alive, should control the planet, and so most of the wealth, regardless of any natural or divine law on the subject.

Here we are now brought face to face with the fact that civilization's grand battle must be fought through diametrically opposed processes, and for totally different aims than the previous millions of battles through the whole course of human history.

*Land possession by all, on principles of ethics, in accordance with the golden rule.* That should be the object of our grand battle, in opposition to all former battles, in which the open or hidden object has always been, how to pile up most land in the hands of the few, and leave the many with as little as possible, in quantity as well as in quality, and so as poor and degraded as possible.

The very nobility and the sublime altitude of the object in view, excludes the possibility of any violence to accomplish the proposed aim. The selfish object of all previous battles involved the need of violence. The grand ethical principle of the battle we have mentioned involves the need of peaceful processes, and hence the complete elimination of that low element, violence, which poisons all that it touches, the sinner as well as the saint, the ignorant as well as the wise.

It will not do any harm for us to briefly expound at least one of the simple processes through which the grand battle could be fought and won at one blow, as soon as a sufficient nucleus of common consensus has been created among our farmers and labor associations in regard to the few fundamental economic principles that humanity needs for life to be a joy forever, and not a mass of negations, an empty dream, a vacuum dark and dreary, as it has always been, even for the few apparently happy ones on the top, because of their influence and wealth.

After a few years of wise propaganda in economic principles, we don't see any reason why a good sized majority could not march to the polls on a presidential election with a ballot containing the epitome of two bills to constitute the foundations of the new social compact, and to become laws by the mere fact of a majority vote, without any interference from congress, because a majority vote is after all the real sovereign power.

We suggest as follows:

#### BILL NO. 1.

*Be it enacted,* Six months after date (that of majority vote by the people) all present forms of taxation shall cease, to be replaced by a 5 per cent. tax on land and franchises values, to commence four months after date, assessments to rest on 70 per cent. of such actual values during last six months of full monopoly rule. Distribution of tax fund, national and local, to be: 20 per cent. administration, 20 per cent. defense or public order, 60 per cent. public improvements, details to be annually determined by popular vote.

#### BILL NO. 2.

*Be it enacted,* Six months after date (that of majority vote by the people) government and silver notes, so far issued, to be alone legal tender for all public and private dues. Government to issue \$250,000,000 per annum additional legal tender notes to cancel the labor values of all public and franchise corporate debts. Total volume not to exceed \$70 per capita, unless decided by popular vote two years in advance. Small coins to be used for change.

Besides the two above bills, improved as much as we may like, the ballot would not need to contain but two names, one for president and one for vice president, as the national executors of said bills, representing the will of the people, mayors to be the local executors. The president and vice president to be selected, one from among the best leaders of the farmers alliances, and the other from among the best leaders of the labor associations, men that we knew we could trust. Besides, the power of such men would be limited to enforce the few simple laws enacted directly by the people in congress assembled—the grand congress of the future. No other kind of congress can give us real freedom, peace and happiness.

We know that all powers not delegated to our elected congress remain with the people. Hence, a majority of the people, through specific popular vote, can cancel our whole parliamentary system, when the people consider it necessary to preserve their legitimate rights and manhood.

To be sure, even the natural constitution of things makes a specific majority vote of the people the only sovereign that can exist, unless we revert to the old theory of monarchs by divine right. They are the only two logical forms of government, government of the few over a pack of serfs, or government of free men as determined by popular majority vote of all adults, male and female, in the nation or social group.

It is folly for any man to fix the process through which the people should march toward all political and economic freedom rather than linger in the midst of economic and political monopolies, as we have ever since that first battle between Cain and Abel for the supremacy of land monopoly. Yet, it is only through individual suggestions that no doubt humanity will find the best way out of the woods in God's own time. Only, God wants men to work out their own salvation, under his guide and aspirations, which are never wanting when we wish to receive them.

## SOME ECONOMIC FALLACIES.

BY W. H. STUART.

It is to be observed that the various economic reforms currently advocated are all, ostensibly, in the supposed interest of the workingman. Thus, for instance, "protection" is advocated on the ground that it would protect us from competition with foreign pauper labor and keep up the wages of the American worker, and enable him to maintain a higher standard of living.

I propose in this paper to show that, under our present system of industrial competition between workers, no changes in our fiscal policy or in our financial system will be of any permanent benefit to the man without capital, and that class, be it observed, comprise the great mass of the people.

Mr. David A. Wells, in his "Recent Economic Changes," lays it down as a self-evident axiom that the average price of our wheat crop is governed by the price the surplus will bring in an overstocked market, i. e., that if we raise 300 millions bushels more than there is effective demand for, that the price the surplus product brings determines the price of the whole crop. I think Mr. Wells is right. Now, what is true of wheat is true of all other commodities, and under our present industrial system, labor, that produces all wealth, is a mere commodity, governed by the same laws of supply and demand that govern all other commodities. Therefore, the value or wages of labor is determined only and solely by the demand. The "surplus" over that necessary demand, determines—the same as surplus wheat—the value or wages of the labor crop.

This is merely stating in other words the "iron law" of wages; a law that under a capitalistic system of production is inevitable and inexorable, from which there has never, nor can be, an exception. A law, the workings of which is acknowledged by all economists, which may be expressed by the formula "that under free competition the wages of labor continually tends to the minimum on which the laborer will consent to reproduce." I do not wish, however, to be understood as holding that the wages of labor is affected as quickly, by an oversupply as the price of wheat, because labor is animate and is apt to resent all lowering of the price of that "commodity." It forms unions and combinations to keep the price up. Nor is the value of all labor affected as the value of a whole wheat crop would be. Unskilled labor is first affected. But the law, in time, is as inexorable and inevitable in the one case as the other. A general reduction in the wages of common labor will, in time, affect the value of all labor.

Judged by this standard, let us briefly

review the various reforms advocated in the interest of labor, and to increase wages.

First, let us take protection. It is urged by its advocates that a high protective tariff enables American manufacturers to compete with the products of other countries, in which the standard of living and wages is lower than ours; that it enables the American manufacturer to pay higher wages and thus keep up the American standard of living. Now a protective tariff may certainly enable the home manufacturer to pay higher wages, but is he compelled to do so? The American manufacturer, while crying loudly for protection to his infant industry, is careful never to protest against free immigration. He wants protection against the products of foreign pauper labor but the pauper himself he welcomes with open arms. Why? Because, as a capitalist whose only object is the production of surplus-value, he wants to retain the home market from the exploitation of the foreign capitalist, and being secure in that, he desires to increase his profits, and for that purpose he desires cheap labor, just as much as he desires cheap raw material. Many workingmen fully understand this, and hence, in many quarters comes the demand for the restriction of immigration. This might afford a temporary relief, but it would be only temporary. The continued introduction of labor displacing machinery would continually augment the army of the unemployed. Every year less men are necessary for the production of the national wealth, i. e., less in proportion to the product.

It will, of course, be understood, that nominal wages will be higher in a protected country than in one in which free trade obtains. If, for instance, protective tariff enhance the price of commodities 20 per cent., then wages must be that much higher to make the purchasing power of wages the same as in a free trade country. Here we see that a protective tariff can have no effect in raising real wages. No matter what may be the increased profits of the manufacturer, he is not compelled to divide or share with his workmen, their wages are determined solely by the supply of labor. The tariff on steel rails has not been reduced, yet, Carnegie has reduced the wages of his men from 10 to 50 per cent. Carnegie does not claim that his business is not profitable, he merely takes advantage of the over supply of labor and if the tariff on steel rails was doubled to-morrow there is no reason why he should increase wages an iota. The men would not accept the reduction to-day if they could help themselves. An increase in the tariff would not place them in any better position to resist the reduction.

Then take "free trade." It is advocated

on the ground that the producer is also a consumer; that the larger number of workmen are engaged in such labor as can not be protected, and whose wages are not affected or raised by a protective tariff; that the free exchange of commodities with other countries would merely reduce the exorbitant profits of the home manufacturers, and that the reduction in the prices of goods would benefit the large mass of workmen by increasing the purchasing value of their wages. It is also claimed that the admission free of raw material would stimulate industry; cause an increased demand for labor and raise wages.

Now let us suppose that industry was stimulated, and that the price of the cost of living was reduced 20 per cent., would not free immigration soon restore the supply of labor, and as the standard of living could be maintained for 20 per cent. less than formerly would not wages under the "iron law" be reduced to correspond to the difference in the cost of living? But, even with no increase in the population, the same result would be effected, for if we now manufactured goods we formerly imported, and thereby gave labor additional employment in such industries, would not such gain be offset by the throwing out of employment of those who produced the goods which we formerly exchanged with other countries for the goods we now produce ourselves? So that we see that the cheapening of the cost of living effected by the adoption of free trade, would merely result in a corresponding lowering of wages. Competition among laborers for employment would still keep wages down to the subsistence point.

Our prohibition friends never tire of quoting the enormous waste of wages for the purchase of liquors—over a billion annually, I believe. It is everywhere assumed that if this money was not wasted in liquor, that it would remain in the pockets of the wage-earners to purchase more of the necessities and some of the luxuries of life. No assumption could be more fallacious. If prohibition was adopted tomorrow and was absolutely effective, it would throw out of employment 250,000 now engaged in the manufacture and sale of liquors. This would increase the competition among laborers, and as the standard of living could be maintained on a billion less than formerly, wages would inevitably fall, and perhaps even lower than that necessary to maintain the old standard of living, this owing to the increased competition. Paradoxical as it may seem, the cost of the liquor, under our present industrial system comes out of the pockets of the capitalists, who are only obliged to pay sufficient wages to maintain the standard of living, the disuse of liquor would enable the work-

ers to maintain that standard on less wages, and competition would inevitably force wages down.

At present, the man who does not waste time or money on liquor, can save the average expenditure for that purpose but should total abstinence become universal he would be compelled to abstain from some other article or articles now in common use to enable him to save something from the average wage.

I hope, however, that none would be so foolish as to use this argument in favor of persisting in the drink habit. The crime and misery caused by the use of liquors, is too great to be offset by the mere fact that its discontinuance would not raise wages. We need sober men with clear and not fuddled brains to help solve the problems that are pressing on us.

The theory of "saving," by the way, is another economic fallacy. For instance, our eminent soup-bone economist, Mr. Edward Atkinson, has invented what he calls the "Alladin Cooker," by the use of which he claims that nutritious meals could be provided for a family of three for one dollar per week, or one-third the present cost.

He is quite out of patience with working men who refuse to avail themselves of his invention. Now let us assume that the saving effect would be what he claims. The result would be that the man with the "Cooker" could subsist on two dollars per week less than those who were without them. Result; those provided with the "Cooker" would underbid for work, this would force all to provide themselves with "Cooker," and as the same standard of living could be maintained for two dollars less per week, competition would in time inevitably force wages down, so that the advantage to the worker would be lost.

Besides, bourgeois economists of the Atkinson stripe fail to see that any lowering of the standard of living, and wages, merely reduces the purchasing power of the consumer. Lower wages means the ability to purchase less commodities, decrease in the consumption of commodities means lessened demand for labor, lessened demand for labor means idleness, bankruptcy of various industries and another lowering of wages and starvation for the unemployed. When our standard of living is lowered to that of the Chinese, four-fifths of our manufacturing industries will be unnecessary. High wages means increased consumption and prosperity, low wages means decreased consumption and its necessary correlative, idleness, poverty and starvation.

I shall now consider the financial and monetary reforms advocated by a large class of earnest people who see in the vicious financial legislation of the past thirty years the cause of all our poverty, and who look

forward to the abolition of our national banking system, the free coinage of silver, and the increase in the volume of money to \$50 per capita, as the sovereign remedy that will extirpate pauperism and give to labor its full reward.

It may be freely admitted that the financial legislation of the past thirty years might challenge all history for a parallel for the wholesale robbery of a people. Yet, as a solution of the causes of our poverty, I mean the poverty of the masses, it is totally inadequate, nor will the reforms advocated reach the root of the matter.

The theory, in brief, is that by contraction of the currency effected by past legislation, and the inflation in the value of gold, the value of all agricultural land and products have decreased enormously. A favorite method of illustrating that reduction in values is to point to the fact that twenty years ago the national debt could have been paid for in so many million bushels of wheat, that now, having paid half that debt, it would require more bushels of wheat than twenty years ago to pay the balance. Senator Stewart estimates the reduction in the value of products within the last thirty years, at 40 per cent., which reduction he ascribes to the inflation of the value of gold and its consequent increased purchasing capacity.

This hypothesis can not be substantiated. The reduction in the price of commodities is admitted, but such reduction can be accounted for on other grounds, and for reasons natural and satisfactory, without recourse to an assumed hypothesis.

Take wheat, for instance. Twenty years ago it could not be produced for less than \$1.00 per bushel; it can now be produced at a profit for 33½ cents per bushel by the bonanza farmer. If it is replied that the small farmer can not produce at the latter price, the answer is, that neither can the hand loom weaver compete in price with the power loom, that the present methods of farming are antiquated and must be changed like manufacturing industries to correspond to improved and scientific methods of production. Land that formerly produced \$1.50 wheat now produces fifty cent wheat. This means decreased land values. A curious thing about this ascription of the cause of the reduction of land values in the middle and western states to inflation in the value of gold is, that the enormous reduction in land values of the New England states is never referred to as the result of inflated gold values. The reason is that the causes operating toward the depreciation in land values there are too obvious, viz.: the competition with the bonanza farmer of the northwest. Land formerly worth \$50 per acre is now selling for \$5 and less. But in the middle and western states,

where the causes of the depreciation in land values are not so obvious, the cause therefor is ascribed to inflation in the value of gold.

But not only agricultural lands and products have decreased in value, but nearly all commodities have depreciated in value, the true cause being, in my opinion, improved processes in production, introduction of labor-saving machinery, and the consequent reduction in the cost of production.

I shall condense from D. A. Wells' "Recent Economic Changes," some facts bearing on this subject. Railroad freight rates have been reduced from 3½ cents per ton per mile to less than one-half cent. Ocean transportation of wheat from New York to Liverpool from 18½ cents per bushel to 3 cents. Telegraph rates six times less in 1837 than in 1866. Quinine from \$1.70 to 30 cents per ounce. Pig iron, \$53 per ton in 1872 to \$16 in 1876. Why should wheat continue at the old prices when every other product and commodity has decreased from 20 to 80 per cent.? Under the stimulus of a failure of European crops in 1879-80 and 1881, the exportation of wheat from this country rose from 40,000,000 bushels to 150,000,000; from a money value of \$47,000,000 to \$167,000,000. But this same scarcity of European crops gave an enormous impetus to the production of wheat in India, which in a few years rose from nothing to 40,000,000 bushels. At the same time transportation rates through the Suez canal fell from 32½ cents per bushel to 16 cents, a difference of 16½ cents per bushel in favor of the Indian producer as against the American.

In addition to those causes, which are obvious, natural, and not hypothetical, the American farmer is suffering from the results of planless over-production, i. e., over-production as far as effective demand is concerned. Not knowing what the rest of the country is producing he continues the production of cereals, hoping the depression in prices is only temporary. To make good the deficit of one or more low priced crops, he places a mortgage on his farm, and as cheap wheat means cheap land, he is surprised when the mortgage becomes due to find that his land will not much more than pay the mortgage, owing to the decrease in land values, the result of the decrease in the value of the land products, which he ascribes to the inflation in the value of gold. He is also suffering from the competition of the capitalist bonanza farmer, who, even at the price that is ruining his smaller competitor, is able to make a profit, who on 50 cent wheat makes a profit of 33½ per cent.

Under no change in our financial system can the small farmer expect to raise the staple cereals in competition with his capi-

talist competitor. Mr. Carnegie has reduced the price of his steel rails from \$100 to \$25 per ton. Might he not with the same show of reason claim that at the former price in 1870 he could have paid off his debts with so many thousand tons of rails, but that now having paid off three-fourths of his debt it will still require more thousands of tons to pay the remaining one-fourth than it would in 1870? Carnegie has adopted all the modern devices for cheapening the product. Science, art and labor-saving inventions have been brought into service; he has also combined with others to keep the output within the limits of effective demand, and has thereby averted ruinous competition through overproduction. But the American farmer continues his isolated, wasteful system of production and imagines that the price of silver has some relation to the price of his wheat, whereas his capitalist competitor the bonanza farmer has, like Carnegie, availed himself of all modern improvements, and the immense saving effected by conducting operations on a gigantic scale. Small farming must go with the stage coach, the hand-loom and the tallow dip; co-operation is the only hope for the small farmer. If he had his debts all paid to-morrow in a depreciated currency the same causes for his downfall would be at work, he would still be confronted with the problem of wheat and other cereals produced profitably at less than half the cost that he could produce. Small production of all kinds is doomed, it is either large production for the benefit of a few capitalists, or national co-operation in the interests of all.

Advocates of the money theory point to the fact that the per capita is actually less than when population was only half what it is now, and they point to that fact as a sufficient cause of the depreciation of property, but a sure sign of the real scarcity of money is a high rate of interest, and it is a fact that interest was never lower than at present, there actually appears to be a plethora of money. Three millions was offered one day by one man in New York recently for one per cent., without takers. The current rate of discount of the Bank of England is two per cent. It should also be remembered that as civilization advances the use of actual money is constantly decreasing, a system of checks and credits being substituted. Bradstreet's report that of the total volume of business transacted, only 7 per cent. of actual money, either gold, silver or paper, is used. Our city, state, national and international clearing houses rendering the use of money almost unnecessary, millions of bills of exchange, checks and drafts being daily liquidated in New York and London, only a few hundred or thousand of pounds or dollars in actual money being required to settle balances. Of the inflation of gold val-

ues alleged to have been effected by the demonitization of silver in 1873 it may be said that the effects claimed to have been effected are grossly exaggerated. In the first place silver was not in effect demonitized; it has been in circulation every since, performing all the functions of money, and not only so, but in a greater quantity than ever before in our history. Up to 1873 only 8 millions of silver had been coined, whereas since then there has been coined, or in circulation in the shape of silver certificates, more than two hundred millions, performing all the functions of money as effectually as gold. No. Contraction or insufficiency of the circulating medium will not account for the depreciation of property and products. It is quite evident that no improvement in our money system, no increase in the circulation, no lowering of the rate of interest will enable the small farmer to compete with the bonanza farm. If interest on money and rent of land was entirely abolished and the circulation increased to \$100 per capita the small farmer, or the small producer of any sort would be at the same disadvantage as he is at present.

It is sometimes urged that an increase in the volume of money, would be lessening its purchasing power, thereby increase the value or wages of labor. To this it may be shortly replied that the same cause that effects the increase in the wages of labor will also raise the cost of the standard of living. It is not a certain nominal rate of wages that men contend for. It is for a wage that will maintain a certain standard of living, any wage that provides that standard will set men to work, whether the nominal wage is \$1.00 or \$3.00 per day.

The day of small things is passing away, never to return. At present large production insures exclusively to the benefit of the capital class, but it only needs for us to adopt a co-operative system of production to enable us all to share in the advantages of the grand industries. When a million more American farmers lose their land, and a couple of million more laborers, useless middlemen, bucksters, small traders, solicitors, etc. are thrown out of employment by the consolidation of capital, we will be ready for national co-operation.

There only remains to consider the single-tax as a method for increasing wages. We have in former numbers of the MAGAZINE discussed this theory in detail and showed the fallacies upon which it rests, and the impossibility, by its adoption, of raising wages. It might, therefore, be dismissed; but for the sake of completeness we will briefly review the argument against it.

The single tax theory is based on the assumption that the factors in the production of wealth are Land, Labor and Capital, that the first two factors are the only indispen-

sable factors, capital being an auxiliary which greatly increases the productiveness of labor. Land being a gift of nature, all should have access to it on equal terms, by a tax that equalizes the advantages of lands of varying productive capacity. Therefore, labor is entitled to the whole product that can be obtained on land at the "margin of cultivation," i. e. on land of no rental value, without the aid of capital. The difference in value above the margin of cultivation would be confiscated by the state in the shape of a single tax on rental values of the bare land. All assistance that labor would receive from improved tools and machinery, would go in the shape of interest, or "the just return," as George puts it to capital for its "aid in production." In other words, interest is the "wages of capital."

George fully understands the working of the "iron law" of wages. He understands thoroughly that under present competitive conditions wages must continually tend to the subsistence point, and he would endorse nearly all I have said regarding the insufficiency of the reforms which I have reviewed, as a means of raising wages. Only in regard to the cause would we differ. He expects that under the single tax, the instruments of production will remain in the hands of the capitalists, for the use of which the capitalists can rightly claim as their wages, all the product above what unaided labor could produce on land of no value. He admits, however, that under a system of private land monopoly, by which labor is excluded, from access to natural resources and opportunities, that capitalists are enabled to retain more than they are justly entitled to as their "just return" for "aiding production." He claims that when labor has free access to land at the margin of production, or land of no rental value, that men will not work for employers for less than their labor applied to such land would produce. That in consequence, labor would receive its "just reward," ditto interest to the capitalists, ditto rent to the community. I have before exposed the absurdity and utter shallowness of this theory. I only want now to draw attention to the fact that the single tax merely offers to the man without capital all he can make on land of no rental value, by his unaided labor. All the value of land above that quality would be confiscated by the state, all the advantages to be derived from improved tools, machinery or other capital would go, as now, to the capitalists. Now the question I ask is what can a man now, without capital, make on land of no rental value, or if you please, on land of considerable rental value? Even our farming class, with years of experience, owning their own land, with considerable capital in the shape of machinery, can not compete with the

capitalist farmer, no more than the small producer of any kind can compete with his capitalist competitor. Why, the smallest wages offered by the capitalists is more than the laborer could produce on free land without capital. I have frequently referred to the fact that within sight and sound of the New England factories were hundreds, yes thousands, of abandoned farms that could be, with their improvements, obtained for a less rental than any single tax would be. But the competition with capitalist agricultural methods, made this land worthless, and factory employees preferred the low wages offered by their capitalist employers to starving on practically free land. My single tax opponents never answer this argument. Silence in view of such facts is golden. This reduces the single tax theory, as a scheme to raise wages, to an utter absurdity. It would excite the laughter of the gods, to see, in fancy, our single taxer tickling his patch on the "margin" with a stick, bidding defiance to the capitalist! And yet, there are single taxers who believe in this theory, who smile at the credulity and ignorance of the man who believes in the Noah and the ark, and Jonah and the whale stories!

We must conclude, therefore, that the single tax, no more than the other reforms which we have reviewed, would afford any permanent relief to labor, or effect any increase in wages. "The iron law" would operate as effectually as at present. Labor would still be ground down under the iron heel of capitalism. Under existing conditions, land and natural resources are merely a form of fixed capital in the hands of the same class. There are really only two classes, the plutocrats and the prolétaire. To release us from this degrading bondage to capitalism, we must control collectively, all the means and instruments for the production and distribution of wealth.

\* \* \*

I have been quite dazzled, and somewhat bewildered at the brilliant exhibition of mental gymnastics given by my friend Borland in the April MAGAZINE, in his effort to find some flaw in the socialist theory of value. I shall have something to say in reply in the June MAGAZINE.

THERE'S never a rose in all the world

But makes some green spray sweeter;

There's never a wind in all the sky

But makes some bird wing fleetier;

There's never a star but brings to heaven

Some silver radiance tender,

And never a rosy cloud but helps

To crown the sunset splendor;

No robin but may thrill some heart,

His dawnlight gladness voicing.

God gives us all some small, sweet way

To set the world rejoicing.

## MECHANICAL.

### STEAM SUPERSEDEES FAILURES.

Since my last article was sent on its way to the printer, it has been in the line of my work to do some exploring into the records of the past, in the line of a long litigation on the merits of some so-called improvements in the "working of steam," and there has so much new matter arisen in its connection that I have decided to put some of it into the way of the readers of the FIREMEN'S MAGAZINE, for it is interesting, and contains a great deal that is information.

James Watt had made certain valuable improvements in working steam in his engines, and the scientific men of his day had not fairly gotten over looking into the theoretical part of his work, when some of the proposed "steam supersedeers" appeared on the business horizon, and men took up the new departures with a zest, as possible means of doing even far better than the new steam engine lately introduced could do. I will give the most interesting of them, as the total would fill an entire issue of the MAGAZINE.

Dr. Cartwright who was really the inventor of the power loom, soon had a "Vapor" engine built, from his own plans, and in his patent claim in English records, date 1797, he claims "the use of ardent spirits, or ether, or any other more volatile spirit than water, either wholly or in part" and his scheme set out another most amusing proposal. "It is to be used or attached to a still, in order to utilize the vapor therefrom, as a means of power, and afterwards condense the vapor for sale," and it appears from a further examination of these old records that the same Dr. Cartwright as long ago as 1801, actually had in operation an automatic cut off, and this was the subject of another patent, but we do not learn any particulars of the use of the vapor engine, but in a few years afterwards, a Mr. Howard, of London, patented an engine, for vaporizing alcohol at each stroke, and it was first thrown by some sort of an injector upon a bed of highly heated oil, and the pressure raised by its vaporization, was transferred by the oil into the cylinder, with which it communicated, and then it (the vapor), was condensed, "by a metal surface of large area, surrounded or covered by wetted flannel, or similar substance, and which was kept wetted, by water on which a stream of atmospheric air was constantly blowing," and we have no definite report of its success, nor what became of it.

In a short interval of time, another inventor pops up, and it is probable that he has substituted quicksilver for oil, as a medium of power, for an extract is made as follows:

"One of the greatest discoveries in navigation has transpired. Three-fourths of the fuel now required in navigation will be saved, the vapor of quicksilver substituted for steam, etc.," but nothing further is found as to it, excepting a number of similar claims, which are too much like "fairy tales," to copy.

In 1842, there was patented in France, the Ether engine, in which ether was used in place of water, and the ether was put into another vessel which in turn was put inside of a steam boiler, and the same person, Du Trembly, in '47, brought out his "Binary" engine, which was to some extent a success. It was an ordinary steam engine, using steam as usual, but he condensed the steam, by contact with a surface which on the other side was in contact with ether in a liquid form, and the temperature of about 15 inches of vacuum produced a pressure of nearly 50 lbs. of the vapor of ether, and this vapor was used in another cylinder to develop power, and the claim for it was that the power was doubled, with no added expense. This was used upon eight vessels and in use so late as 1859. One or more of these vessels were burned, and much difficulty was found in the joints and packings. Some commission was appointed by the government, and examinations made, the coal used was found to amount to 2.8 pounds per horse power or a small amount for the time. It was found necessary to use the Humphrey Davy safety lamp in the engine rooms, to be secure against explosions, and these gave no sort of proper light. Finally all the remaining engines were removed from the ships, although the inventor claimed that if he could be allowed to use chloroform or Bichloride of carbon, all difficulties would vanish, but the men in charge of the machinery had become chary of the engines, and refused to make trips again.

After the London exhibition in 1851, one of these Trembly engines came over to the Novelty Works in New York, and was set to work to drive the shops in regular service. It was started in the hot season, and it was soon found that the high temperature of the condensing water and danger of fire, interfered with its usefulness, and it shortly disappeared. While in this search the writer was amused to stumble over the following statement in "Spence's Encyclopedia:" "The bi-sulphide (of carbon) is easily evaporated to a dense vapor, the heat absorbed for evaporation being about 280 Fahr., that of steam about 1,000 Fahr., a saving of seventy-one per cent. of fuel."

For about fifteen years at intervals the bi-sulphide of carbon scheme appeared in different forms.

In 1872 the Ellis engine, which used a steam engine, with an attachment quite similar in appearance to the new style Tandem-compound engine of '94, and in place of the chloride of carbon he used the Bi-sulphide. Up to this time this chemical had been a high priced one, but some change in its production at this time made it very cheap, as compared with its former cost, and Ellis claimed that with the combined steam and Bi-sulphide of carbon he could make power at 160 per cent. gain as to cost of fuel, or similar claims, the power was to cost almost nothing. The curious fact remains, that a "trial" was made, but it was with an almost obsolete type of engine, and a very wasteful one, and the Ellis engine showed some gain. Upon this showing several firms entered into a company to make the engines, among them were the Atlantic Works at East Boston, Mass., the Haskins Machine Company at Fitchburg, Mass., and the Poole & Hunt Co., Baltimore, Maryland. Thousands of dollars of capital were spent. Mr. Poole was seriously injured, nearly losing his life and in short it soon died out for a time, although many "engineers" gave most gratifying certificates of its economy, and in a short time it utterly disappeared.

Meantime a "new and improved substitute for steam," appeared in Boston, about 1880, which was nothing more or less than our old English friend a hundred years old, alcohol and water, and this was actually put into one of the cotton mills at Nassau, N. H., for a trial, there were the usual number of schemers in it, and the Mutual Insurance companies took a hand in its extinction. This was soon proved a fraud, but the schemers wanted one more chance, and had a tug boat fitted up, to show that it would do the business, and it went down Boston Harbor on a trip, took fire and went to the bottom of the harbor.

About this time a so-called Baptist minister in the city of Lowell, started a new way of making power. It was our old friend Bi-sulphide of carbon and steam, and it was named something like the "Triple Thermic Motor." It proved a "scrap" for thousands of the people turned their savings into the "Pastor's" hands, if the truth is told, and the "brilliant success of the matter" was astounding, but after a while Lowell became too hot for it and the whole thing moved to New York where it was exploited for some time, and as it had done frequently before, it died again.

This was so seriously considered as a means of economy in power that Mr. Geo. H. Corliss went to considerable expense and

trouble to experiment on it in a plant he especially erected in the yard of his works, but he never advised its adoption, nor did he in any try way to make it appear as of the least utility. The Boston scheme was only capitalized at the sum of twenty-five millions of dollars, but capital *did not* seek it for investment.

The actual economy of the bi-sulphide of carbon engine seems to be equal to a condensing engine working with 2.8 pounds of coal per horse-power per hour, using initial of 35 to 40 lbs. per square inch, but taking the real cost of the carbon and its loss the carbon engine costs just double that amount of coal, and its percentage of heat units realized is not over four per cent. of the theoretical.

About this same time, 1880-82, the Woodbury, Patten, Merrill & Woodbury hot air engine came into the market. This has been referred to before in this connection. It has never been in any commercial sense a success.

Professor Rankine in his article on "Binary engines" in 1858-9, demonstrated from his theory, that non-aqueous vapor could or would compete with the vapor of water, under same consideration of circumstances, and he remarked, that "by the addition of another engine, a wasteful steam engine may be converted into an economical binary engine," but he does not say what he considers an economical one.

Aside from the one mentioned, there are many other sources of power as "Carbonic Acid and Ammonia," and of ammonia in a variety of applications.

One of the most curious of the lot was looked into by the writer while in New York in '91. It was a surface motor for the railroads in the streets of New York, and was a sort of hot water stored for power, reheated, and then condensed with an air condenser. It was run for a while with a great deal of noisy claim, and this was to be put on the railroads, and to run with a condenser, was to "revolutionize" the whole business, but a company with a few million dollars of capital was started. The last the writer knew of the thing was that cables had been ordered and now running, while the revolutionizer had been sent to "Pullmann," or in that country, and is now resting from public gaze.

But the tallest scheme was in '80-82, and emanated from Washington, D. C. It was the "Zero Motor," and the intention was to have a boiler in which was ammonia, absorb its heat from the air, and this generated heat or heated vapor, and the energy thus created was applied to running an engine, and after its energy was partially spent in doing work what was left was condensed into fluid again and pumped into

the boiler again to commence its round of duty? This thing was to revolutionize all steamship engines. It had been at work in the Washington Navy Yard, so said, for months, endorsed by officials of the government, and it soon disappeared from the public. A Prof. Gamgee was its inventor. I have not referred to Ericson's Caloric engine for the reason it has once been discussed in these articles, and may be recalled by the reader on reference if desired.

The Air or Caloric engine is too costly to make from crude ideas, but the admixture of air and steam has been one of the ideas of the past, and some of the older ones in engineering will recall the old "Storms" engines, oftener referred to as the "Cloud engine" and which Horatio Allen years ago (1850-1) considered to "be capable of saving nearly fifty per cent. of the fuel used." This engine took in air which was mixed with the steam and it was supposed to make a large saving. This is an old scheme, and has often been tried. In the instance referred to it was again an utter failure, and nothing was heard of it after a trial on a small steamer that used the same coal but in a trifle longer time, but the owner refused to keep it as a saver, and it has long ago surrendered to steam pure and simple.

One of the queerest engines ever seen was examined by the writer a short time ago. This was "a motor for a car." It had a tremendous stock company behind it, and it was a "perfect combustion" scheme with a funny engine; base burner: boiler closed fire pot, and no chimney or smoke pipe, steam at 135 lbs., and base on the bottom of the boiler into which the engines exhausted at a pressure of forty-four pounds per square inch, but the thing was to run a street car, and it did for a week, and then it would not run itself, it had so economized in its construction, that it could not go out of the stable, and it was laid up to die. It only cost a hundred thousand dollars to try to run against such a back pressure as would close any shop.

There are only some of the many "Super-seders." Many more are not named than are, and without doubt many are yet to come. If reports are true there is one in Boston now, which is to revolutionize all that is now running, especially locomotives. The new one is a petroleum burner, it makes its power for a trifle less than nothing, and has some of the oil left? It is going to be as easy to put two thousand horse power into the frame of one of our "Barkers" as it is now hard to get in ten hundred horse power. Perhaps more will be said after its trial.

But the "Electric," locomotive is now coming to the front, it is a combination of steam and "litenin," but the steam power

is increased by the electricity, and it is going to show a great advantage, for no trolley is needed, but we won't all resign until after the Fourth of July.

Thos. Pray, Jr.

#### PERPETUAL MOTION AGAIN.

There seems to be a peculiar fascination about the perpetual motion idea that leads even good mechanics, who might naturally be supposed to be the ones to instantly recognize its fallacy, to waste their energies in the effort for its accomplishment. The *American Machinist* contained an item a short time ago telling of a machinist, who had worked for years at his trade, committing suicide because of his bitter disappointment over the failure of a perpetual motion scheme on which he had worked for years, and because of his final conviction of the impracticability of his idea life had no more charms for him. The *Machinist* thought it strange that one who might surely be supposed to have some acquaintance with mechanical laws should occupy himself with such a vagary, and become thoroughly convinced that it was a vagary only after years of trial. But it is a fact that those who do have a knowledge of mechanics are the greatest perpetual motion cranks. It is they for whom the idea seems to have the greatest fascination, and it is they who stick to it the longest. The latest perpetual motion machine is a perpetual air engine, the creature of the brain of Doctor Theodore Burr, an aged mechanical genius of Detroit, Michigan. The doctor is described as "a little old fellow of 72 years, but as bright as a new dollar. His fingers have the peculiar deftness that only comes with a lifetime of mechanical work, and his gray head has that bird-like poise of the cunning inventor." The doctor's machine is to run by compressed air, and all that is necessary to set it a going in the first instance is to pump up enough air by hand in the accumulator to give it a revolution. It will take care of itself after that, running perpetually and accumulating such an excess of pressure that it will be necessary to have a safety valve on the accumulator in order to get rid of it. The machine is described by the *Detroit News* as follows:

The doctor led his visitor to the center of his shop and exhibited what appeared at first glance to be a compound steam engine of small size. There were two steam cylinders about 4x10 inches with a cylindrical valve chest between them. The latter contained rotary mechanism for governing the admission of steam to the piston chambers and exhausting when it had done its work. Except that the valve was of a unique and remarkable type, the machine might have been considered an ordinary yacht engine. At one side and a little below the other cylinder was a brass cylinder whose piston was operated by a crank on the main shaft. Between this cylinder and the others and connected by steam pipe was an ordinary range boiler of perhaps 20 gallons capacity. "There," said the doctor, proudly, "is the simplest and most economical engine in existence. It will take

care of itself after you have given it a start, requiring neither fuel, steam or electric current. It is not altogether yet or I would show you how simple and yet how wonderfully it works.

"To start it I must pump up a pressure of say five pounds of compressed air in the big reservoir. Open the throttle and the machine moves slowly. By the mechanism of this valve after the pistons are driven to the end of the stroke the pressure is cut back into the reservoir and turned against the other end of the pistons. The exhaust will open at the proper instant but the escape or loss will be but about one pound of pressure, and the rest is saved to be used again. As the pistons are driven back and forth this brass air pump is worked to replenish the reservoir. It will accumulate pressure faster than I can possibly use it, and I must have a large safety valve in the reservoir to prevent it from being burst by the increasing pressure. Suppose now I start with 40 pounds pressure. In each cylinder one pound is used to do the work of pushing the piston one stroke and 39 pounds are forced back into the reservoir. Now I have an increase of 39 pounds for the next stroke: 40 plus 39 pounds equals 79, and twice 79 is 158 pounds in each cylinder. All the time the air pump is working, and you see we must have a safety valve to take care of the pressure as it accumulates."

It was useless to argue with the doctor that he is struggling with a mechanical paradox, beside which the possibility of a man lifting himself by the straps of his boots is simplicity itself.

"People have an idea I am crazy, but I can laugh by and by," said he. "This I know. I have made one such machine a success, and because I could get no patent to protect me I broke it up so that no man should steal my idea. Now I am going to apply my engine to a tricycle, on which I will ride to Washington and put to shame the men in the patent office who say I am attempting impossibilities. The frame of my machine will be strong tubing, which will be my reservoir and at the same time will support the working parts and the seat. You can drive the machine just as fast as a man can stand it to ride, for there is no limit to the power except in the strength of the tubing and cylinder. Come down next week, and I'll have the thing running so you can see for yourself."

The possibilities of such a machine, in a commercial way, are certainly beyond computation, and when the doctor rides into Washington on his perpetual motion tricycle he is sure to create a sensation. And it remains true that the perpetual motion crank is generally a man who is well posted in the science of mechanics.

\* \* \*

Commenting on the action of Judge Caldwell in recognizing the right of employees of receivership railways to a hearing before the court in matters affecting their interests as employees, equally with the representatives of the owners of the property themselves, the *Railway Age* sees gaunt ruin to the railway interests of the country if such a principle is recognized as correct. The *Age's* idea seems to be that the courts have no business to exert their authority in any direction other than for the protection of the property interests of the country, and that they are doing something inimical to the general good and prosperity of the country when they consent to even listen to a statement of the case from the employees' standpoint of their interests. In other words, it is right and just for the courts to accept without any question whatever the statements of the receivers with regard to the necessities of the management of the

property in their charge, and grant everything they may ask for in the way of court orders, on an ex parte statement alone and no matter how such orders may affect the welfare and prosperity of large bodies of law abiding citizens. Of course it is well understood that the *Age* couldn't reason any differently than it does, even if it wished to, but its arguments are sometimes so devoid of even the commonest kind of common sense that one wonders how they can be advanced by an intelligent being. Speaking of Judge Caldwell:

Again, it will be noticed, Judge Caldwell recognizes the "labor societies" as the parties with whom the receivers are to deal, and it would be interesting to know on what grounds of law the Judge takes this position. The immediate effect of the attitudes of these judges upon the properties is a curious one. The Union Pacific railway, being insolvent, is being operated in trust under the direction of the court and in the execution of that trust it is necessary that all expenses should be reduced to a minimum. The courts however are compelling (for a term of some three months, at least) the continuance of a scale of expenditure which the properties cannot support. It is difficult to understand how any rights of employees (and still less of the "labor societies") to any certain fixed rates of pay can possibly be regarded as superior to the necessity of economy in the operation of the trust property. The employees of course can stop working if they wish (and if they do it in an orderly way) but if the principle is to be established that the receivers of a railway are to be obliged, in deference to any established right of labor, to continue to pay in times of depression and insolvency the same rates of wages as were paid in times of prosperity and affluence, it will create another and very formidable objection to American railway bonds as a source of investment and can hardly fail to have a marked effect on the attitude of European investors toward these securities.

Of course, according to the *Age*, the receivers are the only ones who have the right to be heard on the question of "necessary" reduction of expenses. But the point I want to call attention to is the one relating to the "attitude of European investors" towards railway securities as an investment, providing railway "labor societies" were recognized as being entitled to a hearing before the courts. I pass over such questions as whether it is the business of our courts to boom the stock and bond markets, foreign or domestic, or to dispense even-handed justice between man and man, and whether we are really dependent on the "attitude of European investors" or not for the successful operation of our railways; and take up the implication that railway "labor societies" are not recognized in Europe. For, of course, the implication is there, as it would be absurd to say that the consideration pointed out by the *Age* would have any influence with "European investors," with regard to American railway securities, when they are confronted with the same condition at home. Any person who reads the Board of Trade reports of the United Kingdom of Great Britain and Ireland will be at no loss to discover the utter falsity of the *Age's* implication. He will be able to see that we Americans are a long ways behind

our British neighbors in the recognition of the rights of railway "labor societies." To show the extent to which this principle of recognition is carried, I present the following article from the *London Railway Review* concerning a circumstance which happened on an Irish railway:

At the monthly meeting of the directors of the company, held in the Board-room, Tralee, the chairman, Lieut Colonel Rowan, presided, there being also present: Messrs. St. J. H. Donovan, J. P., R. Latchford, J. P., R. M. Cowen, J. P., M. McMahon, J. P., D. Busted, J. P., M. O. F. Slattery, T. C., G. S. McSweeney, secretary, R. A. Parkes, general manager and W. Tomkins, loco. superintendent. Mr. Tomkins reported that he was compelled to discharge Driver Quinn, owing to the general neglect of the engines placed in his charge. After some consideration, it was decided to adjourn the hearing of the charge to the following day. The branch officials then decided to wire for the Irish secretary, Mr. Tevenan, to represent Quinn, who was an old and sterling member of the Tralee Branch. On Tuesday the charges against Quinn were fully investigated, and on Mr. Tevenan (who had arrived by mail that morning), presenting his card to the Board of Directors assembled, he was, after a short discussion, allowed to occupy a seat in the boardroom and represent Driver Quinn. The Chairman called upon Mr. Tomkins to state the charges against Driver Quinn. This he did at great length, and said that this man had treated him with gross insolence and contempt, and in his opinion he was not a qualified man for the position he held. The Chairman asked if Quinn had anything to say in defense. The charge of insubordination was a serious one, and in the interest of the company it was their duty to see that such was stopped. Quinn denied the statements made by Mr. Tomkins, and said he had given his statement to the Irish secretary of the society, Mr. Tevenan, who had come from Dublin to represent him. Mr. Tevenan said he thanked the whole of the directors present for having extended to him the privilege of being present to represent the interests of Driver Quinn. Very serious and grave charges had been made by their superintendent against Quinn. In his opinion, a deal of personal feeling had been imported into the case, and he was glad that they had given every opportunity to Quinn to place his defense before them. The most serious charge that had been brought against this person was that he was incompetent to fulfill his duties. If there was the slightest ground for this he admitted that they were perfectly justified in dispensing with this man. One or two points in the charges made he wished to review. First, this driver had been in their employ since the line first opened, and prior to that he was a competent fireman in the service of an adjoining company, who demanded as great competency from their men as any railway in the country. During the time he had been with them they had advanced his wages for his abilities; and he maintained that if the Board supported his dismissal they would, in effect, be stultifying their own action regarding his qualifications. Until the present superintendent's advent not a single complaint had been made against Quinn, and he thought it was one of those cases that ought not to have been placed before them at all. On Quinn's behalf, he might say that he was anxious to do all in his power to perform his duties to the satisfaction of the loco. superintendent and themselves, and he trusted that the Board would consider the question favorably and reinstate him in his former position in their service. There was no doubt that the superintendent felt aggrieved, but he could assure him on the part of Quinn that he was mistaken in his conclusion, and that no offense had ever been intended. The superintendent said he was quite satisfied with the explanation made on Quinn's behalf by Mr. Tevenan, and he was quite willing to sink all differences if Quinn gave a guarantee that he would do his work properly in future; he was not opposed to him being taken back again. Quinn gave the guarantee, and the Board reinstated him in his position. The Board expressed the hope that the two men would work in harmony in future. Mr. Tevenan desired to express his sincere thanks to the Board for having given him an opportunity of placing the case of Quinn

before them. Their action was unique in the history of the Irish railway service, and he trusted that their action would be copied by other directors. The chairman said, on behalf of the Board, that they were all pleased to meet him, and he thought they all appreciated his services on the present occasion, and that the society Mr. Tevenan represented ought to prosper under such a wise and respectable leader.

Just imagine the directors of an American railway occupying themselves with the consideration of so small a matter as the discharge of an engineer, and admitting a grand officer of his "labor society" to plead his case before them as against one of their own officers. And then imagine them, if you can, deciding in the engineer's favor and reinstating him in his position. We have a long ways to go yet before we shall be as far advanced in the recognition of the rights of "labor societies" as they are in Europe.

W. P. Burland.

#### Brake Valve on Lap.

MR. EDITOR:—In January Magazine Mr. Garaghty puts the brake valve on lap and calls for some one to find a direct communication from air gauge to train line; and Mr. Andrew Reid, in the March number, presents proof that there is such communication. I want to say to Mr. Reid that his proof is not satisfactory here in Alabama. It is easy to furnish proof on any subject if you can get people to believe what you say, but Mr. Reid will have to furnish some other proof before we will accept it here. There are five positions for the brake valve: (1.) Full release, where all pressures are equal. (2.) Running position, where the air passes through a small port, by the excess spring, leading from main drum to train line. (3.) Lap position, where all ports are blanked. (4.) Service position, where air is drawn out of the equalizing drum—or, as the boys call it, the drum under the running board through preliminary exhaust. This air comes off from the top of piston seventeen, and the train line pressure underneath, being greater than that above it, raises the piston and allows air in the train line to flow to atmosphere; and thus the triples are brought into action. (5.) Emergency, or all the way around and stop right now, position, where the large cavity in the rotary is brought into position to place the train line in direct communication with the atmosphere. And when you make an emergency application you do not draw any air out of the equalizing drum, as the cavity in the valve seat and in the bottom of rotary are brought into communication only when valve is in service position. When engineer's valve is on lap, as Mr. Reid said in the March number, let the air out of the train line at the back end of tank and the black hand will fall back. This is true, but it does not prove that there is direct communication from train line to air gauge. When the air is let out of train line there

will be a slight leak through the packing ring in piston seventeen. Though the leak be ever so small it will show on black hand, as the volume it is leaking from is so small; and all packing rings are more or less leaky. It will leak through joints if nowhere else. There are two positions of the brake valve where there is no direct communication from air gauge to train line. These two positions are lap and full emergency. I will say to those who study air brakes that it has been my experience that much more can be learned by taking the valve apart than can be learned by reading instruction books. I have a question: Suppose we have two brakes, one with a six-inch piston travel and the other with an eight inch travel. Let us make an application, anything short of full service, say eight pounds, which one of those brakes will release the easier? Again, let us make a full service application and which one will release the easier?

BIRMINGHAM, ALA.

*J. A. Harrell.*

#### No Communication While Valve is on Lap.

MR. EDITOR:—In March MAGAZINE Mr. Andrew Reid says that there is communication between train line and air gauge when brake valve is in lap position; but Mr. Reid does not tell us through what parts such communication takes place. There is no direct communication between train pipe and air gauge while valve is in lap position, nor after the brake valve is past service application. The train line pressure can be entirely exhausted and it will be several seconds before the black hand will drop back to zero. Why is it? And where does the air go to that allows it to fall back to zero? We know that the gauge is attached to the equalizing drum.

*L. A. Ogden.*

GRAND RAPIDS, MICH.

#### Information Wanted.

MR. EDITOR:—I notice a great many ten wheel engines that have their eccentrics on lead driving axle; and I want to know how such an engine could be run in case a strap, or pin was broken on front end of side rod? With the opposite rod taken down there would be no connection with the eccentric axle. I have put this question to a number of engineers but have failed to receive a satisfactory answer.

COLUMBUS, GA.

*W. A. Willis.*

#### In Answer to Questions.

MR. EDITOR:—In answer to Mr. Garaghty's question in the January MAGAZINE, "Is there any communication between train pipe and air gauge when brake valve is on lap?" I will try and explain the action of the engineer's brake and equalizing discharge valve. I wish first to explain how the air passes from the main reservoir to

the train line when valve is in running position. With this valve (D 8) the air passes up through the valve at the right side, where there is a gauge connection for the red hand which denotes main reservoir pressure; the air is then on top of the rotary valve, passing down through the feed port (J) in the valve body and against feed valve (2 1) which is provided with a small spiral spring requiring a tension of 20 pounds to compress it so that the air can feed through into the train pipe. This is where the excess pressure arises; after the air passes by this valve it is reduced from 90 to 70 pounds. Now we have air in the train pipe, but it will have to travel up in the cavity (C) of the rotary before it is admitted to the equalizing drum. Now, in cavity (C) it passes down through the equalizing port (G) on top of the piston (17) to which the equalizing drum is in communication; also, the air gauge for train line is connected in this same cavity (D) on top of piston (17). This engineer's brake and equalizing discharge valve is simply a triple valve worked by hand. When the valve is in the lap position all ports are blanked and no air can feed from the main reservoir to train line, nor from the train line to the equalizing drum. So it can be plainly seen that there is no communication between air gauge and train line. The rotary valve laps over the equalizing port  $\frac{1}{2}$  of an inch, so all the air pressure to the gauge is that in the equalizing drum. It is true that if the train line is leaking the gauge will show it by dropping back, but that is on account of air leaking out of the equalizing drum through the packing of piston (17). You can open the angle cock on the back of the tank and the hand will remain almost stationary for a few seconds, then drop back gradually. I would ask Mr. Reid to try this with a valve of the D 8 type, after being in service for a short time. The D 6 brake valve is on the same principle, only provided with a feed valve attachment and a warning port to prevent carrying the valve in full release. In answer to Mr. Ginter's question: Plug the main reservoir gauge fitting in the brake valve and put the valve in full release. The train line gauge will then show the pressure in main reservoir.

In February MAGAZINE I noticed an article asking some one to give an account of the new brake valve in freight service. I will state the volume of air required for both passenger and freight, and the reader may judge for himself if it is good enough for freight. We will take a passenger train of fifteen cars; equipped with the 14 inch cylinders, this train will require 90,500 cubic inches of air, at a maximum pressure of 70 pounds, to operate the brakes satisfactorily. With a freight train of fifty cars it will require 82,500 cubic inches of air, at a max-

imum pressure of 70 pounds, to operate the brakes satisfactorily. Also, an engine for passenger with a main reservoir of 16,000 cubic inches capacity, and one for freight with a reservoir of not less than 20,000 inches capacity; so we have 4,000 cubic inches more with which to operate the freight than the passenger. It is true, too, that a freight train requires more air than a passenger train does. Passenger cars are looked after at each end of their trip, while a freight car seldom gets an inspection; they are all the time on the go and are never tested by many roads, consequently they are often very leaky, and are frequently switched around the yards with the hose hanging down striking ash piles and such stuff. The hose catch quite a lot of this foreign matter, and it is carried up into the pipes, working into the check valves of triples and causing very bad handling of the brake; also, getting into the rotary valve and cutting the seat. In fact, the foreign matter picked up by hose causes two-thirds of the whole trouble we have with air brakes.

Will a leaky rotary valve set brakes?

COVINGTON, KY.

P. P. Holler.

#### Pressure in Main Reservoir.

MR. EDITOR:—Replying to Mr. Ginter's question, asking how to determine how much pressure is in main reservoir when pump governor refuses to work and main reservoir air gauge pipe is broken, I will say that when engineer's valve is in release position the train line gauge will give the pressure of air in main reservoir. But, when excess pressure spring is set to carry 20 pounds excess pressure, there will surely be 20 pounds more pressure in main reservoir than in train line when engineer's valve is in running position.

SPOONER, WIS.

John N. Edwards.

#### Air Pressure Won't Work an Injector.

MR. EDITOR:—Answering Mr. J. M. Bunker's questions: First, his dead engine simply rolls the first five miles, she is not towed, and the lever must remain in the forward motion; if he reverses the engine she stops; I cannot see how he is going to get any air pressure. Second, if he will watch the steam gauge when throttle is open and engine in back motion he will notice an increase of pressure on the gauge. In fact his injector will break a great many times, as an injector will not work by air pressure.

HUDSON, MICH.

J. E. Chase.

THE official gazette at Peking has recently published a severe rebuke to the Bhuddist priests for denouncing the railway locomotives as the cause of the recent illness of the mother of the emperor. The august lady's illness was produced by other causes.

#### Questions and Answers.

The following questions and answers have been clipped from *Locomotive Engineering*:

H. C. S., Gladstone, N. J., asks:

Why is it that in plate D 26 special quick action triple valve (for six-wheeled truck), the stem in emergency piston 8 is hollow the entire length, and what the horizontal port shown directly underneath the piston-head is for? Also, explain the purpose of middle port in valve seat. A.—Six-wheel truck brakes have a 14-inch cylinder, and, in order to make this release in the same length of time taken by a 10-inch car cylinder, there had to be a larger exhaust port; this was done by boring holes through the stem of the emergency-valve piston (8) and from them to the top of piston; this provides enough extra area to make the release uniform. The stem of emergency-valve (10) seats against and closes this top port, or hole, when the emergency piston is forced down.

W. H. S. Danville, Ill., writes:

I wish to know the best acids or composition to be used to write your name on tools; also the best covering to be used to protect the metal from the action of the acid. A.—The best corrosive compound for this purpose is a mixture of one ounce of nitric acid with one-sixth of an ounce of hydrochloric acid. Cover the article to be marked with beeswax, write with a sharp steel scribe and apply the compound with a fine brush. Allow the compound to stand five minutes, then dip in water and clean thoroughly.

C. C. M., Bennett, Pa., asks:

If the branch pipe be taken off an injector and another one put on which is much larger, will the injector throw water into the boiler? To show my meaning: Suppose I procure a branch pipe 6 inches in diameter, and attach it by suitable reducing apparatus to an injector and check of the size commonly used, will or will not the injector work, and why? A.—Yes, the enlarging of the pipe won't make any difference after it is once full of water. The injector simply supplies a water pressure in the pipe.

W. V., Detroit, Mich., writes:

What effect does it have on the forward motion to move back-up eccentric back half an inch? A.—It will make the valve open more slowly when the engine is linked up in forward motion. Advancing the back-up eccentric is sometimes resorted to as a means of increasing the speed of valve opening when hooked up in forward motion. Under some circumstances the latter change will make an engine smarter.

B. L., Chattanooga, Tenn., asks:

1. What is the ordinary temperature of a locomotive smoke box and how is it found

out? A.—The temperature varies from about 600° to 1,600° Fah. when the engine is working. The temperature is usually measured with a pyrometer which works by the expansion of metal. 2. In figuring heating surface, is it customary to take the inside or the outside surface of the flues? A.—The outside—that is, the side exposed to the water. 3. Is there any hard and fast rule for establishing the radius of a link? A.—No; when a designer is laying out a link motion he uses the radius of link which will serve best to adjust the steam distribution. It is generally drawn from the center of the driving axle, but sometimes it is made longer or shorter.

W. H., Winnipeg, Man., writes:

1. If you lengthen the back-up eccentric rod  $\frac{1}{4}$  inch, would it make any difference to travel of valve when engine is in forward gear two notches from the center? A.—It would affect the travel slightly. 2. Train was coming into a station and engineer put engineer's valve to service stop and brakes would not work. Piston 17 was not stuck. Put handle to emergency position and the brakes worked all right. What was the trouble? A.—We are afraid that if piston 17 was not stuck it worked mighty hard; possibly the preliminary exhaust port was stopped up.

#### Oil Fuel at the World's Exposition.

An interesting report on the results of using oil fuel at the Chicago Exposition has been presented to the Standard Oil Co. by Mr. Charles F. Foster. This statement avers that the use of oil as fuel has been entirely satisfactory in every particular. During the period the Exhibition remained open, the main boiler plant consumed 10,614,401 gallons, or 74,300,805 pounds of oil for generating steam; developing the aggregate energy of 32,315,964 horse power hours, at a cost of 6.3 mills per horse power hour. The contract price for the oil delivered in the Exhibition tanks was 72½ cents per barrel of 42 United States standard gallons. The boiler house force and equipment comprised 210 burners, atomizing oil beneath 52 boilers with a standard rating of about 21,000 horse power, and attended by a staff of 42 men divided into three eight hour shifts. The saving in cost of both fuel and labor for the oil fuel, as compared with coal of fair quality at market price for large quantities, is apparent. An equivalent consumption of from 500 to 600 tons of coal per day would have been necessary, so that for the duration of the Exhibition 70,000 tons of coal would have been needed; and Mr. Foster remarks that "it would be difficult to imagine how this vast amount of coal would, in the limited space available, have been handled expeditiously and without endangering life and property." The saving to the Exhibition by the use of

oil fuel was about 27 per cent. as compared with the estimated cost of coal, including the labor of handling. The oil plant worked from start to finish without a break; and the smokelessness and absence of odor from the chimneys of the boiler house were made a subject of general comment.—*Scientific American*.

THE necessity of scaling down interest obligations and dividends to meet changed conditions is being forced upon railway companies in increasing numbers. As the example is given in a circular just issued by the directors of the Detroit, Lansing & Northern company, in which security holders are notified that on account of a falling off of business, caused in part by the exhaustion of the timber along the line, which the slow growth of the country in manufacturing and industrial industries fails to make good, added to the fact of increased outlay for needed improvements, the property is not now able to earn the interest on its bonds. Its obligations, including bonds and guaranteed stock of subordinate roads, aggregate \$5,611,000, on which it has been paying interest at from 5 to 8 per cent—the majority at 7 per cent. Formerly the company carried this load and also paid dividends on common stock, but for years the stock has had no return and now the fixed charges are not earned. The directors, therefore, propose to exchange for the old securities new 4 per cent. bonds, accompanied with a bonus of new first preferred stock equivalent to from 16½ to 50 per cent. of the bonds, according to class, thereby cutting down the fixed charges from \$354,000 to \$251,000. As the net earnings for 1893, under unfavorable conditions, were nearly \$262,000, it appears that the new bonds can be carried comfortably, and although security holders do not relish reduction of interest, it is probable that they will be glad to accept the proposition as better than the results which might be expected from foreclosure and reorganization.—*Railway Age*.

THE assertion is made in *St. Nicholas*, a magazine published in this city, that there are only four men in the world who know how to run a geometric lathe properly. This is the machine that makes the scrolls and arabesques on the backs of bank bills. It adds: "Indeed, the man who now has charge of the geometric lathe at the bureau of engraving and printing is the only one in the United States at the present time who knows how to manage it, and if anything should happen to him it might tangle matters up for awhile in this important branch of our Uncle Sam's big government." If the fact is as stated—may we question it—it is a very curious one.—*The Engineer*.

## WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER.

Letters for publication should be directed to Mrs. Ida A. Harper, Stanford University, California.

### HOUSEHOLD ECONOMICS.

In reading the articles devoted to women and their interests, in the various papers and magazines of modern date, one would be inclined to think that most women had entered the professions, the trades, the factories, or were engaged in some other wage-earning occupation, so much attention do those attract who are at work outside of the home. But the truth is that the vast majority of women are and always will be employed within the household, and we have no more important questions to consider than those which relate directly to the home interests. We are too apt to dismiss them with the feeling that they were settled long ago, that our grandmothers solved every problem, and all that is necessary for the woman of to-day is to follow in their footsteps in domestic affairs. This is a great fallacy; it would be just as sensible to say that farming should be carried on by the methods of the early days, or that men should do business after the fashion of a century ago. There has been a decided revolution in housekeeping, a readjustment of its burdens, and, while its demands are just as numerous as of yore, they are of a different character.

The spring time especially brings many perplexing questions. The annual house-cleaning has become much more systematized; houses are more thoroughly "gone over" every week, almost every room is in daily use, and not so much dirt and debris are allowed to accumulate. To those fortunate housekeepers who have hard wood floors and rugs, house cleaning has no terrors. It is the tearing up of the carpets with their layers of dirt, the beating out of this dirt, the scrubbing of the floors, the relaying of the carpet, with the stretching and tacking and all the attendant evils that really constitute the chief bane of house-cleaning. All the rest seems play in comparison. We would advise those who can not have hard wood floors to try the plan, in one or two rooms, at least, of painting the floor a width of two feet around the walls and laying a rug in the center. Once a week have it hung on the line and beaten while the floor is being wiped up, and see how you like the plan after a year's trial. Once a week wash the windows, brush down the walls and dust the pictures, and when spring comes you will find that there is really no house-cleaning to do in those rooms.

We are beginning to see the value of educating our women, in the application they are making of their knowledge in the home; in the better understanding they have of sanitation, of heating, lighting, ventilating, of healthful food, of correct dress, and of many other practical subjects. They have come to believe that temperance and morality are very closely connected with these things, as well as are health and comfort. Associations are being formed in many places for the scientific study of these questions, and competent women lecturers find great demand for their services. In several places schools have been established for the careful training of girls for domestic service. One of these schools has been founded at Saratoga, New York, by the wife of Spencer Trask, a wealthy banker. Here girls are trained to be skilled cooks, nurses, laundresses, etc., and the graduates command the highest wages. Cooking schools are springing up in all parts of the country, where both mistress and maid may learn the best that can be taught. Whatever pessimistic critics may say to the contrary there never was a time when women were more anxious to understand the domestic sciences, and the homes of the future will be more perfectly managed than ever they have been in the past.

In a recent lecture given by Mrs. Minerva Tobey, vice-president of the National Housekeepers' Economic Association, she gave the following description of an ideal bedroom:

A southeastern or southwestern outlook; an open fireplace; a warm air register at breathing height—not on the floor; a hard-wood floor, with rugs; walls hard-plastered and painted, or papered with non-absorbent washable paper; a metal bed, with an air mattress; plain furniture without upholstering, and no window draperies except those which can be washed easily.

Most of these requirements are possible in every family, and yet we find that, with many, the ideal bedroom has a brussels carpet, upholstered furniture, heavy draperies, a much-carved bedstead and a stationary washstand. The germ or bacterian theory has become so fully accepted nowadays, that all of us ought to know how to arrange our bedrooms so that they would neither breed nor harbor the germs of disease or ill-health. This should be done in all the rooms of the house, but it is vitally necessary in the sleeping apartments. That thrifty housewife is passing away who prided herself upon making her bed before breakfast. The sensible one makes it after dinner. As soon as one rises the bed covering should be thrown loosely over some chairs by an open window, and the mattress and pillows placed in a draft of air, which should be allowed to circulate through the bedroom for several hours. At least once a week the bedding should be put out of doors in the sun. The garments that are worn during the night

should never be rolled up and placed under the pillow, but, after being thoroughly aired, should be hung up until needed. Everything about the washstand should be kept perfectly clean, and the test of the room should be that coming into it from the outside air, there should not be the slightest impure odor. There cannot be too great care in this regard, if one wishes to feel well and to have a clear, healthy skin, good digestion and sound sleep.

The spring is a trying time. There is apt to be sickness in the family, and those who are not actually ill are weak, tired and miserable. It is not possible to say how much of this is due to the winter's confinement in close, badly-ventilated rooms. The house should be put in a thoroughly sanitary condition, from the garret to the cellar, every closet, nook and corner. The system should be cleansed of all impurities and, if necessary a mild tonic taken. Very often hot water or hot milk, taken night and morning, will answer the purpose. The tasks should be lightened and as much rest as possible secured. The housewife is apt to be neglected at this season, for it is the busiest time of the year for her, and she is engaged in looking after all the rest of the family. Husband and children, see that the mother is well cared for. There is no danger but that she will take care of you. What a chapter might be written of the unthought-of mother, the one who spends all her life in kindly service for those around her. The family grow so accustomed to this service, to being waited on and petted and always remembered by her, that they accept her devotion as a matter of course, and too often fail to render any acknowledgement of it. No one but these patient, self-sacrificing mothers know how keenly this indifference is felt, for no complaint ever is made. The hurt is too deep for that. A mother's pure unselfishness offers the highest example of heroism. It asks no return, and yet there is an intense longing for some sign of appreciation. A loving word, an affectionate caress, such as are lavished upon the children without measure, if given by them to the mother, would refresh her heart like dew and fill her soul with new strength. Alas, that husband and children should be so careless in bestowing them, so regardless of the wealth of love and tenderness that is so freely and unceasingly poured upon them.

From house cleaning to parental and filial love—does that seem a long leap of the imagination? It need not be, for it is at this season of the year, perhaps more than at any other, that the demands upon the housewife are greatest and that the practical manifestations of her devotion to her home and family are most apparent. It is at this time that she is especially in need of assistance and sympathy. If any one doubt this,

let him ask her if it is not true; or if he hesitates to put it in words, let him offer some kindly assistance and loving expressions and note how gratefully they will be received, and with what a light step and cheerful heart the heaviest burdens will be carried. Make the experiment and be convinced by the result.

#### THE WORKING WOMAN.

Every one who gives even a superficial reading to the newspapers and magazines of the day must be struck by the prominence given to the wage-earning woman and the various aspects of the labor question as they relate to her. Each month, in looking over the clippings I have made, I am surprised at the number I have on this subject. Most of them I drop into the waste basket with much reluctance, for all seem important and worthy of consideration. Among the many collected since last I wrote, I find an article by the Commissioner of Labor Statistics, Carroll D. Wright. He states that a systematic collection of statistics contradicts the prevalent idea that women are paid less than men for the same kind of work. He finds, however, that woman's physical endurance is not equal to that of man and that she does not prepare herself as well or take as much interest in her work as men do, because she looks forward to marriage as a release from it. Mr. Wright thinks that the industrial development of women will result in a decrease in the number of marriages and an increase in the number of divorces, but he does not think this would be a bad thing, as it would end by establishing woman's social and intellectual equality, and would bring about higher moral conditions and greater happiness in the world.

Walter Besant, in London, is still opposing women in the employments. "Suppose," he says, "that 10,000 women have positions, that means 10,000 idle men, who will have to emigrate. Therefore there will be 10,000 women left without husbands and 10,000 possible families will not be founded, and, at the low estimate of four children to a family, 40,000 possible children will not be born, and the country will lose the work, brains and productive, fighting and colonizing power of 40,000 citizens." This is very ingenious, but we must consider, among other things, that there is an immense surplus of women in England and, therefore, all the women cannot marry and must either support themselves or be supported by men. Also, we must remember that possibly two-thirds of these children would be girls and, according to Mr. Besant's scheme, would become only that many more consumers. Then we must recall that there is already in England an army of unemployed, of hungry and home-

less, and there is no immediate demand for increasing the number of marriages and children. Mr. Besant will have to hunt up some stronger arguments against permitting women to enter the occupations.

The New York *Sun* prints a column of the employments now open to women and declares that they are crowding into practically every avocation formerly followed by men. The article closes with this declaration, which is full of truth:

Of course now men are greatly alarmed lest the old and honorable institution of marriage fall into innocuous desuetude because men will not be able to marry and support wives on the wages they can earn. If men had had more respect for this old and honored institution, more eagerness to avail themselves of its opportunities, and had lived more fully up to its principles there would not be so many women fearful of entering into its bonds, or eager for release from its indignities.

The Chicago *Herald* calls attention editorially to the great injustice done to women by the "sweat shop act," passed by the Illinois Legislature. It provides that no woman shall be employed in any factory or work-shop more than eight hours a day or six days in a week. As it leaves men free to work as many hours as they please, it will be seen at once that it shuts women out of the employments where the men work more than eight hours a day. An example is given of the great butter and cheese factories of Illinois, where eight hours' work a day would not enable the women employes to take the milk through the absolutely necessary processes to make the butter or cheese. It is an example of one class legislating for another, and there should be a representation of women in the Illinois legislature to watch the interests of women.

The New York *Ledger* has a strong article on "Business Women," in which it says: "The fathers of daughters will live to see their girls reflecting quite as much credit on them by their business faculties as ever their sons did." It closes with the following paragraph:

It is all very well to talk about women in business and say disparaging things of them and indulge in all sorts of little vicious slaps and uncharitable remarks; but when one comes down to actual facts, the business woman of to-day stands well up in the ranks. When it is taken into consideration the obstacles they have to contend with and their newness in this sort of work, this is not the least remarkable feature of the situation. The country is full of women who raise their families with great credit to themselves, and, meanwhile, conduct various sorts of business with the very best financial results. Comparatively little is said about it on account of a tendency in the minds of many men to discourage and belittle anything that looks like feminine competition in the business world. But all these men are wasting their time and strength. The movement is as resistless as all of the other processes well started and is going on with a force of evolution.

That very able writer, Eliza Archard Connor, dishes up the subject in such a clever way that we cannot resist giving a long quotation from her article. After pay-

ing her respects to the man who declares that women have no business to leave housekeeping, dressmaking, etc., she says:

But what is the proper opinion to hold concerning men when they go into house work and dressmaking, as so many are doing in constantly increasing numbers, this male person does not say. Neither does he tell us that he thinks the young woman should step down and out and go off and starve in order to give him, the male person, back his place, but we infer that this is the case. The long and short of it is, when men support women, women do not need to support themselves. But men do not and cannot support all women in our time; therefore women must and will earn their own living. We would sacrifice much for the dear men, whom, one and all, we adore. But starve? No. It is not men's duty to support all the women. It is the duty of men and women to do exactly as each individual pleases about the matter. If a man wants to earn bread for a woman, let him, if she is willing. But if she wishes to or must support herself, then, by all the laws of justice and common sense, it is as much her right to choose her occupation as it is that of any man ever born. Manly men recognize the changed conditions of society and give all the aid and encouragement they can to the woman who must get her bread in paths hitherto untrodden by her sex. They know that it is development and necessity that have forced this choice upon her, and they would die before they would lay one straw in her way. But as to the male person who comes with his whine and howl about women's crowding men out of their employment—well, heaven send him better light and knowledge.

In the Tailors' Co-operative Society of Glasgow, it was found that women were taking the work at less wages than the men. The latter demanded that all the women be dismissed and, when the demand was refused, they struck. The employers finally made peace by arranging that the women should receive the same wages as the men. This is the method we always have advocated; not that men should try to force women out of employment which probably keeps them and their families from starvation, but that they should make common cause with them against a common enemy for the common good.

#### EDITORIAL PARAGRAPHS.

A strong effort was made to secure a bill from the Virginia legislature providing for a woman physician in each of the insane hospitals of the state, to have the care of women patients, but the men refused to pass it. Nothing would seem to be more just than that insane women should be cared for by physicians of their own sex, but there are very few states where it is permitted. Wherever it has been tried it has been a decided success, but this is one of the offices that is used as a political reward, and women are not entitled to political rewards. It is true that the helpless, insane wards of the state may suffer in consequence, but that does not cut any figure.

The delegates to the National Grange, which recently met at Syracuse, N. Y., represented over a million farmers. They adopted the following resolution:

Resolved, That the National Grange is in favor of

granting to women the same privileges at the ballot box that are granted to men.

This action has since been endorsed by the several State Granges.

The Trans-Mississippi Commercial Congress, which met in San Francisco, with distinguished delegates from twenty-two states, adopted an out and out woman suffrage resolution.

The Kansas State Teachers' Association adopted by a unanimous vote, a resolution extending full suffrage to women.

The Central Labor Union, of Boston, representing 40,000 workmen, has again petitioned the Massachusetts legislature to grant municipal suffrage to women.

The Protestant ministers of Colorado and the Catholic bishops and clergy, gave strong support to the woman suffrage movement during the recent campaign in that state.

We quote these authorities to show the wide range which is covered by the advocates of equal suffrage.

On February 14th, at Littleton, Mass., Mrs. Amelia A. Frost was ordained a minister in the Congregational church. The council appointed to examine her and decide upon her fitness, represented ten churches. It is the first instance where the Congregational church ordained a woman to preach. Mrs. Frost is the wife of a minister and when his health failed she took up his work and has been preaching very acceptably for some time, but without the official sanction of the church. During the ceremony Dr. Quint, Boston's old and honored minister, said: "This council has set aside prejudice and disregarded precedent. We have not called you, but we believe that the voice of God has called you, and we recognize it." In giving the right hand of fellowship, the Rev. Richard Meredith said:

If St. Paul were here he would stand up and justify every word he said about women, and express astonishment that holy men and women had so clung to the letter of his instructions, and then he would sanction our action to day. I am here to welcome you fully, cordially. I congratulate you on your opening ministry. I am not afraid of any editor or any Doctor of Divinity. I welcome you as a full fledged minister, for time and for eternity.

How strange it seems that the churches should have denied to women, for nineteen hundred years, the right to preach the gospel of Christ!

As soon as the suffrage was granted to the women of Colorado the sixty-eight leagues of the Equal Suffrage Association took up the systematic study of political questions, using Fiske's Civil Government as a text book. At the annual banquet of the Manufacturers' Exchange, in Denver,

the wives of the members were invited. The wife of ex-Governor Routt received an ovation when she responded to the toast, "What Colorado Women can do for Home Industry." Mr. Jeffery, President of the Rio Grande Railway, made an eloquent speech congratulating women upon the possession of citizenship. The Denver Chamber of Commerce passed a resolution "heartily approving the efforts of the Woman's Political Club to advance the interests of the state by recommending the increased consumption of home products by every housekeeper in the Rocky Mountains." What becomes of the argument of the opponents that if women become voters they would lose the respect of men? At the present writing, twelve thousand women in the city of Denver have registered to vote. These include almost all of the wealthy and prominent women of the city, according to all reports. What becomes of the argument that the better class of women would not vote?

Margaret Richardson applied for admission to practice law at Norristown, Penn., and was refused by the Bar Association, who adopted a resolution saying, "We deem it inexpedient to permit women to practice at the Bar." She carried the matter into the courts and they gave a decision in her favor. In their decree they say, "If we should draw the line at sex, why not at color or nationality?" Another woman was refused admission by the bar at Carlisle, Penn., and in its refusal this honorable body expressed itself as follows:

Whenever men stay at home, nurse the children, and do the housework, while the women battle with the world, it will be time enough for the Carlisle bar to modify its rules and admit women to membership.

About this time one of the newspapers of that section contained an account of a trial at Carlisle, for murder, where the judge, who was a candidate for re election, ordered that the jury should begin all the whiskey they could drink. One would naturally suppose that a bar which would permit such conduct would object seriously to the presence of a woman. Fortunately, however, the supreme court of Pennsylvania has decided that women are eligible to practice law in that state, and they cannot be prevented by the prejudice or selfishness of a few intolerent men.

At the recent National Woman Suffrage Convention, held in Washington, D. C., United States Senators Carey, of Wyoming, and Teller, of Colorado, and Representatives Davis, of Kansas, and Pence and Bell, of Colorado, spoke from the platform, while among the women speakers were a number of wives of congressmen.

The Iowa senate has adopted the law which prevails in Missouri, providing that if a man abandons his wife and children and refuses to provide for them he shall be imprisoned in the county jail not more than one year or shall pay a fine of not less than \$50 or more than \$1,000. This may be hard on the man, but how is it going to help the family? If the man goes out of the state, as he probably would do, he escapes all punishment. If he can get off with a fine of \$50, that is much cheaper for him than to support his family. If he stay a year in jail, he is maintained in idleness at the expense of the tax-payers, and has contributed nothing either to his family or to the commonwealth. What should be done in such cases, and also in those of wife beaters, is to put the man at work at so much a day, part of his earnings to go to the state or city to pay for his maintenance, and the remainder to his family for their support.

The women of Philadelphia pay taxes on \$30,000,000 worth of property, but are without representation. Our forefathers called this tyranny.

The general Federation of Woman's clubs has now a membership of 300 subordinate clubs, representing over 40,000 women.

#### NOTES.

Mrs. Kate Jones, 109 Spring Row, near Lombard street, Baltimore, Md., desires to learn something of the record of her husband during the Civil War. His name was William Jones, he was a native of Boston, and was a fireman on a road leading out of that city. He served in the navy, and afterwards was an engineer on the P. W. B. road, and lived in Baltimore. He died Nov. 11, 1886. His wife will be glad of any information, should this meet the eye of his old comrades.—Our poets should remember, when they commence their verses with "thees" and "thous," that they should not drop into "yous" before they finish. We would suggest to our prose writers that, while it may save their time to write "&s," it takes considerable of the editor's time to go over their manuscript and change all of them to "and".—We throw readable letters into the waste basket every month because the writers did not sign their names. Every writer dislikes to sign his or her name at first, but in a little while the embarrassment wears off.—Several interesting topics have been proposed, among them that of Dress Reform. We would like to hear from our correspondents on this subject.

#### An Explanation.

The January number of your MAGAZINE contains a criticism of the woman who is studying mathematics and astronomy at

Johns Hopkins University. It is not true that the University will not give credit for the work performed, and if it were, that fact would not and should not cut any figure; she is studying for the learning, and not for glory. The MAGAZINE states that a woman with small children cannot do such work without injustice to herself or to her family. The absurdity of such a statement in the utter absence of knowledge of Mrs. Davis' physical and mental capabilities, can best be illustrated by a simple statement of the facts in the case: The eldest child is about five, the youngest six months. The mother is never away from them over three hours at a time, and very seldom that long, and they are always in charge of a first-class nurse who has been proven thoroughly trustworthy. The mother bestows about as much time and attention on her children, and is with them more, than the average mother of a family, and far more than the average society lady, whose time and strength are largely consumed in shopping, calling and entertaining; and a plumper, rosier, happier trio of little ones, cannot be found. The mother is in perfect health herself, and has gained considerable weight since entering the University, tipping the scales now at nearly 160 pounds. The whole criticism is founded on the fallacy that pleasurable, elevating work is injurious to health. It is hopeless, heartless drudgery that kills, or the ravages of worry and anxiety. Remove all these elements, and the cases of injurious over-work will be exceedingly scarce. Mrs. Davis' taste for mathematics, and her genius for handling it are so great, that her present occupation is the most fascinating pastime she could choose, and she is moreover, endowed with a most extraordinary physique.

It ought to be sufficient to state that the course pursued by Mrs. Davis has the cordial endorsement of her mother and her husband, as well as the rest of her friends: and it is respectfully submitted that their interest in the welfare of herself and children is fully as great and as legitimate as that of the editor of the MAGAZINE, even on the assumption that Mrs. Davis' private family affairs are proper subjects of public criticism.

A. P. D.

[We cheerfully give space to the above letter from Mr. Davis. It is a pleasure to hear from a husband so loyal to the interests of his wife. We beg to assure him that there was no intention to offend, or to criticize his family affairs, and it will be noticed that we mentioned no names in the paragraph in question. When a woman has distinguished herself as Mrs. Davis has done, of course she must expect public mention of the fact. Many of the newspapers in the country contained a notice of her entering Johns Hopkins and spoke of this being the

more remarkable as she is the mother of three children under five years old. If it seem wise to Mrs. Davis and her family for her to enter college for a difficult and extended course, it certainly would be an impertinence for outsiders to offer advice. We wished to say only that, speaking from general knowledge, we consider it somewhat of a risk for a mother with three babies to attempt it. There are very few women who would be capable of doing it. It is not the number of hours that are actually spent in the university, but it is the double number that usually must be occupied in preparing the lessons, writing the theses, etc. There are exceptions, however, in all cases, and Mrs. Davis only proves more fully that she is a woman of superior ability. We shall watch her progress with the greatest interest and feel an especial pride in her achievements.

Our understanding is that Johns Hopkins University does not confer its degrees upon women.—En.]

#### *The Making of a Woman.*

"The education of a girl resolves itself into a single statement," writes Edward W. Bok, in the January *Ladies Home Journal*. He says that if a mother allows herself to listen to the proclaimers of so-called "advanced ideas," she will be led into the mistake of cultivating the mind at the expense of the heart. But the error is a cruel one, painfully so, to the girl who is led, unknowingly into it. We do not want our daughters to be encyclopedias, but true, womanly women. The first we can buy; the latter we cannot. Teach by example as well as precept the value of outdoor exercise. Then begin mental development. Let her study, not up to her fullest capacity, but just a little this side of it."

I have copied only part of the article. After reading it as it was copied from the *Journal* by the *Nonpareil*, I gave some thought to the sentence, "We will be led into the mistake of cultivating the mind at the expense of the heart." In exactly five minutes I counted fourteen girls in my own city (I counted thirty during the day), good girls, girls of respectable parents, that had, through their affections, been led astray. Does Mr. Bok mean to say that if a woman's mind is cultivated to its fullest capacity the woman will be less loving and tender? Let him look at the big-hearted women of this, or any other country. Who are they? They are the brainy women, the women whose minds have been developed, expanded, and broadened. Mr. Bok says, "Let her study not up to her fullest capacity, but just a little this side of it." Now that involves a nice little decision. Who would dare set a limit to the mental capacity of any one, even a woman? How are we to

know just when to call a halt? Why has not a woman the same right to climb to the tree-top of knowledge that man has? Don't we all know that the mind is elastic? As we acquire knowledge the mind expands, grows, so to speak; becomes healthy and strong, and is able to contain and retain more knowledge? But if we set a limit, if we cease to study and think, our mental power wanes and becomes dwarfed and shrivelled. Mr. Bok says "we do not want our daughters to be encyclopedias, but true, womanly women. The first we can buy, the latter we cannot." Does Mr. Bok think there is danger of our daughters becoming so learned? If he had been in as many houses as I have, where there was not even a common school dictionary, and the mother couldn't tell her boy what a silver certificate was good for; and when he asked her what a black back was, told him it was a negro, he would probably change his opinion. A lady of my acquaintance refused an offer of young marriage. She afterward, in speaking of it to her mother, said, "I could not afford to marry that young man, though I know him to be industrious, sober, and of good moral character. I could love him, but I will not allow myself to do so. His income is so small that I would have to practice the closest economy. I would have to deny myself many little pleasures and recreations that I now have, because as a wife and mother I could not earn what I now do. I would be cramped, mentally and physically. On a small income, with, perhaps, a family growing up around me I would have to give up so many things. Love for husband and children would have to be meat and drink. I have made my choice, I have chosen for myself." I suppose Mr. Bok would say this girl was selfish. He would say her mind had been cultivated at the expense of her heart. I saw she was sensible. She counted the cost, and decided she could not afford it. Why should a woman sacrifice herself for her affection? Too many women have sacrificed body and brain for love. A woman, whose mind has not been highly cultivated, does not know how to love. Mr. Bok need not fear for women's affectionate nature. It will not suffer, even though she be educated to her fullest capacity, her affections will be refined, purified and strengthened. Then we shall not hear of so many unhappy marriages. Educated women, when they give themselves in marriage, demand an equivalent. They can usually take care of themselves, and do not marry for board and shelter. A truly educated woman is always a true womanly woman. Mrs. M. Orrell.

MURPHYSBORO, ILL.

[Mr. Bok is able to secure for his ideas the very wide circulation of the *Ladies Home Journal*, for the reason that he edits that

publication, and editors do not put their own writings in the waste basket. He has said even more illogical and foolish things than those quoted above. Although still quite young, he has solved the "woman question" to his own entire satisfaction; but his influence is not sufficiently strong to injure a cause which has had for its advocates such men as Henry Ward Beecher, Wendall Phillips, George William Curtis, George W. Childs and scores of others of similar ability.—Ed.]

#### TO W.

If thou wouldst always love me as thou lov'st me now.  
 Wouldst clasp me to thy heart with love's caress,  
 Shower kisses on both lip and brow,  
 Enshrine my image in thy loving breast,  
 Misfortune I would bear with thee,  
 And bearing it would faithful be.

If thou wouldst always love me as thou lov'st me now,  
 Our thoughts would intermingle pure and true,  
 Earth then would seem more bright and fair.  
 Would tinge our lives with roseate hue:  
 While love would be the day star of my life,  
 And heaven could give no joy apart from you.

If thou wouldst always love me as thou lov'st me now.  
 'Twould be the dearest boon thou couldst bestow;  
 Our thoughts would fill my soul with joy supreme,  
 A joy that none but me could know:  
 The trials of this world would bring no fears.  
 Thy love would shield me from all grief and tears.

#### Woman's Rights.

We hear a great deal said of woman's rights, woman's wrongs, of woman's mission, and all those sort of things. We believe in woman's rights, but what are they? Are there not false ideas current in reference to woman's rights, we mean her rightful position.

Pardon us if we introduce here a few words about woman; with your permission we will take you into the garden of Eden.

Now, first imagine Adam in Paradise; everything to please the eye and charm the ear, and minister to a pure taste. If ever there was a being of whom it could be said, "It is good for him to be alone," that being was Adam, and yet "it is not good that man should be alone; I will make him an helpmate for him." The creation was incomplete without woman. If God has attached such importance to female influence as to pronounce the Eden of his own planting a solitary abode until Eve inhabited it, shall we not attach importance to the fact sufficient to assert the higher character of her destiny.

Burns says that nature tried her 'prentice hand on man before venturing on the finer task of fashioning woman; but men in general are slow to admit woman even to an equality with themselves, and the prevalent opinion certainly is that women are inferior in point of intellect. We however cannot come to a decision in the question

until the position of women in society is such as to give fair play to their capabilities.

Take a class of boys and girls learning the same lessons or studying the same subject; you never find the girls inferior to the boys, their memories are as strong, their perceptions as clear, and their understandings are as vigorous; they learn as fast and as easily comprehend what they are taught. But let a woman grow up with the idea, as we once heard a little boy say that "while the chief aim of man is to enjoy himself forever, the chief aim of woman is to get married;" that her sole object is to look out for a suitable match; that she needs no insight into science; that "to be literary is to be blue;" that she is to have no vocation in which the cultivation of her intellectual power is necessary; that if she is too learned she will frighten away the young man who intends never to marry a woman who knows more than he does; that she must contract her intellect to the dimensions of his; that all the education and training will be of no use to her when she is married; that she will have no time for music or no necessity for natural philosophy, and the education which is to elevate her will be pursued with a listlessness and apathy that always fall on man or woman engaged in any pursuit of which they can say, "What is the use."

Now there are various judgments by different individuals of what is sensible in man.

Leslie tells a story of a captain of a packet-ship, who often had ladies placed under his charge for the passage, and who was sometimes consulted in love affairs that occurred on the voyage. One one occasion, a lady, who was very attractive, received particular attention from three young gentlemen, and consulted the captain as to which of them *she should encourage*. "Well you come on deck some calm day, and I will have a boat lowered, and you shall jump overboard. I'll take care of you, and we will see which of them will jump after you." She did so, jumped overboard, and two of them leaped into the sea after her. Now here was another difficulty; which of these two should she encourage? She consulted the captain again and his advice was "Take the one that did not jump, he is the most sensible man of the three."

Please excuse us if we are a little way from our subject. We are not advocates of woman's rights according to the theory of strong minded women, and we have but very little sympathy with what are called "strong minded women," who would thrust women out of her sphere, and force her to occupy a position for which she is not qualified in any respect. Woman in her

phere is all-powerful, but dress her up in male attire, let her unsex herself, and sacrifice woman's tenderness, and modesty to an insane desire for woman's rights and she loses her influence for good.

*Nanna and Juliette Roberts.*

BENTONVILLE, ARK.

[There are some good points in the above article, but we cannot quite understand why the first part should attempt to prove that a woman's mind is as strong as a man's, and the latter part should declare that the writers have no sympathy with strong-minded women. They do not want woman thrust out of her sphere and dressed in male attire, through an insane desire for woman's rights. We think our correspondents should write another article and tell us who is trying to do this, and also explain what they understand by a "woman's sphere" and "woman's rights."—Ed.]

#### *Our Lives.*

It is said by a sweet poet,

"Sculptors of life are we as we stand,  
With our lives uncarved before us;  
Waiting the hour when at God's command,  
Our life dream passes o'er us.  
Let us carve it then on the yielding stone,  
With many a sharp incision:—  
It's heavenly beauty shall be our own—  
Our lives that angel vision."

Living our lives, is like building a new house. We should build one first, to know how to build. Experience is the best teacher.

To me, who have almost reached the high noon of our allotted time, life seems a rough, desperate struggle for existence with us all. As I look back over the long, rough path, I wonder if, could I be set back to the beginning of my journey, would I do any better. We seem to go on and on blind-folded, not knowing what lies before us. Oh, the person is a billionaire who can meet these trials, troubles, vexations and disappointments of life, with a brave heart, shoulder his burden and go on. It seems to me that almost the greatest blessing we could receive would be a cheerful disposition, to make the best of everything, always look on the bright side. We can look twice through this kaleidoscope of life. One view is dark, gloomy and sad, the other is bright, sunny and cheerful. Now our looking at it thus, will not change it one way or the other. Let us keep the bright picture before us. 'Tis a grand, beautiful world. How often our troubles are blessings in disguise, if we could only see it so. This life is too short to stop to grieve at the thorns that pierce us. Let us reach for the roses, there are more of them than thorns if we search for them. We can all cultivate this good trait of character, if we do not possess it by inheri-

tance. A cheerful heart can do great good in this world. Surely it "doeth good like a medicine." Let us live our lives cheerfully, at least, if we can't all live them grandly and nobly.

*Currie E. Mitchell.*

KEITHSBURG, ILL.

#### *LIFE'S TASK.*

Let us help to bear the burdens,  
That we meet with everywhere,  
If we lighten others' sorrows  
Ours will be less hard to bear.

Enter homes where hope has fled,  
Leaving nothing in its wake  
But ruined, blighted, lonely lives,  
And hearts that only beat to break.

Let kindness be the balm we use  
To soothe and heal the wounds of care,  
Tell them of the Saviour's love,  
And the "Home" where all is fair.

And when life's task is finished,  
And we leave this world of sin,  
We may hope at Heaven's portals  
To be told to enter in.

LEADVILLE, COLO.

*Nellie Lawless.*

#### *A Judge.*

A county judge in Hungary gave a decision a few days ago of which Solomon himself might be proud. Members of the Nazarene sect in the town of Gyoma requested his honor to be allowed to crucify one of their number, "who was a messiah and had been called by heaven to save men." "Friends," he replied, after recovering his senses, "I do not wish to interfere with your religious practices. If your messiah wishes to be crucified, let him prepare himself for death. Remember, however, that if he does not rise again in three days I shall cause every one of you to be hanged." The Nazarenes, it is needless to add, allowed their chief to live.

#### *A Homemade Barometer.*

A barometer which is said to be reliable may be made by filling a common wide-mouthed pickle bottle to within three inches of the top with water. An ordinary olive oil bottle is then inverted and placed within the mouth of the pickle bottle as far as it will go. In fine weather the water will rise into the neck of the flask higher than the mouth of the pickle bottle; in wet or windy weather it will fall to within an inch of the mouth of the flask. Before a heavy gale of wind, and at least eight hours before the gale reaches its height, the water has, it is said, been known to leave the flask altogether.

A NEW device for ballroom decoration consists in the freezing of incandescent lamps into large and prettily-shaped blocks of ice, which serve the double purpose of giving forth coolness and light.

### GOVERNMENT CONTROL OF RAILROADS AND EMPLOYEES.

Persons calling themselves "Nationalists," and others, perhaps, who choose some other designation, advocate the ownership and the management of the railroads of the United States by the federal government.

We are not, at this writing, inclined to discuss the financial aspect of the proposition; how, if the government should conclude to purchase the railroads, the money could be obtained to pay for them, but instead, to call attention of the readers of the MAGAZINE to conditions that would most probably confront employees who would be required to operate the roads, a branch of the subject which does not seem to have attracted much attention, if, indeed, it has been broached at all by the advocates of government ownership of the railroads of the country.

It is eminently prudent to say that it is a question in which railroad employees are vitally concerned, and upon which their views should have due consideration. Nationalism, at least, as applied to railroading, is paternalism, or wilder still, Bellamyism—an ism which dwarfs out of sight the individual, while it indefinitely expands government control to absolutism. It must be this, necessarily, since there is no appeal from the dictum of the government. The subject warrants exhaustive criticism, and the more it is investigated the more urgent the analysis appears.

The value of the railroads of the country is now placed at \$11,000,000,000—or about five times the cost of the war of the rebellion—and the number of employees required

to operate 175,223 miles of track of these roads, as reported December, 31, 1892, approximates 1,000,000. In case the government should own and operate these roads, they would be practically consolidated into one great system, and the interests involved would be of such vast magnitude as would probably make it necessary to create another department of the government. To manage an establishment of such enormous proportions would require military discipline of the most rigid character, in which case employees *enlisted*—that would doubtless be required—they would at once come under laws and regulations of a cast iron order from which, as has been observed, there would be no appeal.

Here it becomes pertinent to inquire, first, in case of government ownership and management of the railroads, would the organizations of railroad employees as now constituted be tolerated? Is it to be presumed that immediately upon the passing of the ownership of the roads from the corporations to government all grievances would disappear, and a railroad employees' millenium would dawn? But suppose employees should insist upon maintaining their organizations with all of their grand officers and machinery for presenting grievances and ordering strikes, is there a man who entertains the idea that the government would for an instant permit the slightest interference with its orders and regulations? A moment's reflection discloses the preposterousness of such a conception. Employees might be permitted to maintain organizations of a beneficiary character to improve the moral, social, educational and financial condition of their members, but the government would make all regulations relating to time and wages, nor would it for a moment distinguish between a scab and a union man; belonging to an organization would cut no figure at all, and as a consequence, organizations would at once be required to relegate all their machinery for protection to the limbo of forgotten things. As well expect enlisted soldiers in the regular army to maintain organizations for the purpose of criticising orders of superiors, presenting grievances and proposing to strike if concessions were not granted. Indeed, under

laws already in force, as interpreted by certain United States judges, it is questionable if railroad employees connected with the train service are any longer free men, the interpretation of the law being that they are a part of the rolling stock of the corporations, held to their places by the force of law.

With such facts in sight, is it not to be presumed that, under Government control of the railroads, the first thing Congress would do would be to make laws concerning their management? Such a conclusion is not only logical, but inevitable. The laws thus enacted would doubtless confer upon a department, which the law would create, the duty of making rules and regulations for the management of the roads. The Government, having become a "common carrier," would brook no delays—and employees would not be consulted any more than soldiers in the army are consulted about their movements. "Obedience" and "silence" would be the watch words—and any infraction of the rules would be punished with military promptness and rigor.

With Government control of the railroads, contracts between the Government and the employees, would be based upon law, with penalties attached of more or less severity, in which the punishment of recalcitrant employees would only be considered, because, though the Government might be in the wrong, there would be no process by which it could be arrested, tried and punished, the Government would be King—and the maxim is "The King can do no wrong," only the subject, the slave, the employee—hence the proposition for the Government to control the railroads becomes a species of despotism, such as applies to the control of armies.

In the management of the railroads, the Government would want about 1,000,000 men. It is not to be presumed or assumed that the Government would tolerate any happy-go-lucky policy relating to the required force to operate the roads. It would insist upon order. The trains must go their ceaseless rounds, day and night. What more natural than the inauguration of a system of enlistment for a term of years? during which the men, while permitted to

die would not enjoy the privilege of quitting, any more than soldiers in the regular army may throw down their muskets with impunity. Desert, they might, but as desertion is a perilous business, employees once in the toils, would probably prefer to serve out their time, rather than be hunted down by spies and detectives governments have in their employ.

Again, suppose an employe was discharged from the service as the lightest penalty the authorities could inflict, what would be the condition of the unfortunate? He would be practically branded as an outcast, blacklisted to an extent that he would not be permitted to enter the service again. True, he might be pardoned and reinstated, but the government, having absolute control, would doubtless prefer that such degraded employees should be warnings to others to obey orders and be silent.

As to the matter of wages, if the government should purchase and control the railroads, what assurance has labor that wages would be higher than at present? Indeed, what is there to inspire the belief that wages would not be reduced below their present averages? Manifestly, there is nothing upon which labor can hang a hope that its condition would be improved. If the purpose of the government should be to pay high wages and at the same time reduce the cost of transportation, there might be developed the fact that the business, like the postoffice department, was not a self-supporting enterprise, in which case appropriations would be required to meet deficits. If such a condition of things should occur, a cry would be heard demanding retrenchment and reform, and thus to avoid deficiencies wages might be reduced, in which event, what means of redress would be in sight for the employees? The grievance committee, even if one existed, would not chirp, and the coming together of grand chiefs, and grand masters and grand lodges would be missionless. Neither strike, kick nor boycott would be tolerated. Mass meetings and *whereseas* would avail nothing, and all that would be left for the employe would be submission and silence.

Whatever else may be said of the government ownership of railroads, it is difficult

to see in what regard the employe thereby would be benefited. We regard it quite too early to advocate absolutism in industrial enterprises. As matters now stand, there is quite enough of petty and pusillanimous czarism in shop, forge, factory and mine and in the railroad service, and labor, we feel warranted in saying, does not clamor for more subjugation.

### THE LABOR PROBLEM

We are by no means oblivious of the fact that the caption of this article is a somewhat antiquated chestnut—hackneyed to an extent that rarely falls to the lot of any industrial or economic subject within the realm of discussion, but does it follow, therefore, that the labor problem has been discussed to an extent, and so exhaustively that it should be laid aside?

It so happens, that notwithstanding a thousand pens and ten thousand tongues have been engaged in solving the labor problem, it still remains unsolved, and if we are to believe only a part of what we hear and see, the conclusion is inevitable that the labor problem, now, as peremptorily as at any time in the past, challenges men of the largest abilities to wrestle with the difficulties it presents.

There are those, insignificant neither in number nor mental grasp, who do not hesitate to affirm that the labor problem involves the perpetuity of the cherished institutions of the American government. It was a saying of the lamented Lincoln, that this government "could not exist half free and half slave," that slavery or the form of government would have to be abandoned, and now, the assertion is made that this government cannot exist with a contemptible minority of plutocrats, and an overwhelming majority of proletariats, and the proposition is woven into the warp and woof of the labor problem.

No man, who gives the subject a moment's serious thought, has failed to observe, on the part of the plutocratic class the attitude of employers towards employes. In certain cases, there is a mock solicitude for their welfare, and repetition *ad nauseum* of the old Shakespearean saw, "There is a divinity that shapes our ends," that is to say, shapes

the workingman's ends so that he can be driven into the mud and kept there, and on the other hand, shapes the ends of the rich employer, so that, regardless of winds and tides he is always on top, and booted and spurred, astride of the workingman, rides him whithersoever he will, always claiming that some "divinity" is responsible for conditions as they exist; that it is Heaven's order, and therefore, any resistance only serves to fasten the fetters more securely, sink the workingman deeper in the mire, and lift the employer to higher altitudes of opulence and independence.

It is worthy of remark, that of late it has become popular in certain quarters, to inject into the labor problem about everything politicians wrangle over—such as government ownership of railroads and telegraph lines, the single tax, bimetallism the initiative and referendum, and so on to the end of the chapter, including the transfer of labor organizations, rank and file, to some one of the political parties. By such a harum scarum policy the real labor problem is practically lost sight of, however notorious the leaders in the scramble may become. To make things if possible, still worse, Bellamyism is often hitched on to the labor problem, and thus vagary and hallucination, arm in arm, may be seen almost any day, blazing the way to some Utopia where only so much labor is required to gather up and stow away the wealth.

We hold that primarily and fundamentally, the labor problem involves *wages*—and that when wages are adjusted upon a basis of justice, the labor problem is practically solved. It was said by the Master in His sermon on the Mount, "Seek ye first the kingdom of God and His righteousness, and all these things shall be added unto you." That is to say, don't go roaming into the realms of discussion and waste your time and strength, but rather find the one thing needful and go for it with all your might, and when found, grasp and hang on to it. Things of minor importance will come necessarily and inevitably and be added to your stock of valuables. Hence, we infer, that the supreme purpose labor should have in view, is, to secure just wages; and this obtained, all other things that labor needs

will be added as certainly as that there is such a law as gravitation.

What are the other things to be added? Preliminary to giving an answer directly, we assume that money has power to secure the other things referred to. Money may not work miracles, but it does work wonders—and these wonders are seen on every hand—and hence, we observe that the man who seeks for money and finds it, adds indefinitely to his possessions—and the more money he secures the greater is the number of things which go to make up the sum total of his assets. With the rich, it is called "income;" in the case of the workman, it is called "wages." To those at all critically observant, it will be found that men with the largest incomes have the most of the things which go to embellish homes—and it requires a master of fine writing to describe the luxuries which their incomes command—and it is easy enough to mark the upward grade in surroundings from incomes of \$5,000 to \$5,000,000.

We have read, time and again, in the preambles of the constitutions of labor organizations, that their purpose was to advance their membership morally, socially and intellectually, all of which is well enough in its way, but which, omitting the supreme demand, wages, is of little consequence in the discussion of the labor problem.

We hold that the fundamental idea of labor organizations should be wages, precisely as with capitalists, the purpose is dividends, and with merchants, profits. Syndicates, trusts and monopolies, pools, also railroad corporations, are not organized for moral, social and intellectual improvement of their members, but to make money, to improve their financial condition, and to this one thing they bend all their energies, and thus it should, in our opinion, be with labor organizations to obtain wages, the higher the better.

We urge the wage method of solving the labor problem because it alone can solve it. Workingmen everywhere, we refer to organized workingmen, demand just wages, their fair share of the wealth they create, and as we approach that point, workingmen become contented. The day a workingman receives what he believes to be just wages,

with him the labor problem is solved and it never will be solved until just wages are secured. If this is true, and we challenge denial, why waste time and breath over minor questions? Why clamor for single tax? Why run mad over nationalism, another term for parentalism? Why resolve to go pell mell into some new fangled political party? Why get hoarse over the initiative and referendum? Why not, on the contrary, unify, solidify and federate to secure honest, fair and just wages? And above all, why should labor writers and speakers be constantly repeating the stale platitude, that "Capital has rights as well as labor?" Capital will take care of its rights. It will never abdicate any right, and, moreover, labor does not seek to wrest from capital any of its rights. It simply contends that capitalists shall not longer starve and degrade it by methods which have prevailed since history was rescued from fable. Labor is the investment, wages the dividend. With fair wages the labor problem is solved.

#### CHESTNUTS IN THE BURR.

Mr. Z. H. Holbrook, of Chicago, recently delivered an address on the "Homestead Troubles" in which he discussed the relations of "Capital and Labor," and concluded with the following resume of the points made:

1. Work is a blessing, not a curse.
  2. The greatest philanthropist is he who furnishes employment to others.
  3. Aggregations of capital are beneficial to society, as they reduce cost of production.
  4. Capital and labor are partners, but capitalists and laborers are not.
  5. Labor must choose between the certainty of wages and the vicissitudes and risks of profits or loss.
  6. Having chosen wages as its part, when wages are paid the obligations of capital cease, except such as pertain to the domain of private conscience.
  7. The obligations of capital to share profits with labor are no greater than those of others to share their surplus with the needy.
  8. No man can show authority for dictating to capital its duty to labor when agreed wages have been paid.
  9. Honesty, industry and thrift are the basis elements of wealth.
  10. The capitalists of to-day were the wage-earners of yesterday, and the laborer of to-day can become the capitalist of to-morrow.
  11. The mounds of property are dissipated by the sure laws of nature, hence the state does not need to assist in the work.
  12. It is not a crime to acquire and to own. It may be a crime not to do so if one has the ability. Acquiring must not be confounded with avarice.
- Finally: Man has an inherent and inalienable right to labor, and this right must not be interfered with by unions or strikers. It is not the business of government to aid in the acquisition of money or to make property, but to protect every man, the hum-

blest and the wealthiest, in his lawful efforts to acquire and to enjoy the fruits of his labor.

We are inclined to devote some space to Mr Holbrook's chestnuts, separate them from the burr and examine them *seriatim*, from 1 to "finally."

To say that work—labor, toil, drudgery—synonymous terms, are one or all blessings and not a curse constitute debatable propositions.

It is often said that millionaire employers work quite as hard as their employees—as for instance, Carnegie and Frick work as hard as do the men who stand in front of fiery furnaces, or who, handling the molten iron, transform it into steel or roll it into plates. It is only required to state the foolish falsehood to see it collapse.

Work is the general term as including that which calls for the exertion of one's strength; it includes toil, which expresses a still higher degree of painful exertion, as also drudgery, which implies mean and degrading work. The fact is, work—labor, toil, drudgery—involving different degrees of physical effort, if we are to believe the Bible, are so many curses, or, taken together, are one curse, resulting from disobedience. Let us go to Genesis, chapter iii, and note if work was originally designed as a blessing:

"And unto Adam he said, Because thou hast harkened unto the voice of thy wife, and hast eaten of the tree of which I commanded thee, saying, thou shalt not eat of it, cursed is the ground for thy sake, in sorrow shalt thou eat of it all the days of thy life. Thorns also and thistles shall it bring forth; and thou shalt eat the herb of the field. In the sweat of thy face shalt thou eat bread till thou return into the ground."

If that does not sound like a curse rather than a blessing, the world has labored under a mistake for six thousand years.

To make the curse still more bitter, there has been a ceaseless spawning of mercenary scoundrels, who, when men work that they may eat bread, stand ready to rob them, and it was this robbery by Carnegie and Frick, which brought about the Homestead troubles.

2. In the coinage of nonsense into words, the mint never set afloat a greater vagary than Mr. Holbrook's declaration that "the greatest philanthropist is he who furnishes employment to others," since it is well known that the great majority of employers are as far separated from the philanthropist as the dog star is distant from the earth. A philanthropist loves his fellow men; the employer loves himself. The philanthropist seeks to have the great army of workers secure fair wages that they may be happy; the average employer is everlastingly engaged in reducing wages and

adding to the woes of workingmen. In that nefarious business, Carnegie and Frick were engaged at the time the Homestead trouble began. A man-eating tiger or a lamb-eating wolf are philanthropists quite as much as Carnegie and Frick, and others of their ilk.

3. It is now almost universally conceded that aggregations of capital are a menace to the free institutions of the country, and constitute a colossal curse, and it is only moral deformities that attempt to justify the rascally methods by which the aggregations of capital are secured, by saying they reduce the cost of production, unmindful of the haggard fact that they are making men, women and children so cheap, that human life, in the estimation of those who control aggregations of wealth, has little, if any value at all.

4. Here is where Mr. Holbrook states facts worthy of universal acceptance. Surely "capital and labor are partners" irrevocably so. Have always been partners since the first drop of beaded sweat, in obedience to God's command, stood out upon a laborer's brow, and but for the Carnegies and Fricks, whose counterparts have lived and lied, robbed and oppressed from the beginning, labor would have been spared the crushing ordeals through which it has passed. Capitalists and labor are not partners. The footpad and his victim are not partners any more than Job and the devil were partners, and the hope is that as in the case of the man of Uz, labor may adhere to its integrity and eventually, like Job, regain its rightful possessions in spite of capitalistic satans.

5. The choice which labor is to make is between the dignity of manhood and the degradation of the menial; whether he will be a man or a mouse; whether he will control himself or be controlled by others.

6. Right you are. When workingmen obtain by organization and federation what they decree are fair wages, and the sum is paid in cash, obligations cease. There is to be no hypocritical sniffing on the part of capitalists as to what they can do for labor. Labor will take care of itself. It will not be insulted by slobbering paternalism.

7. The obligations of capital, or capitalists, are just what labor imposes. Labor does not demand a certain share of profits. It demands fair wages. Labor does not have to be told that over and above what it receives, there is a vast surplus that goes to increase the fortunes of capitalists. But labor, uninfluenced by base desires, does not envy those who thus grow rich. It simply demands fair wages.

8. Capital owes no duty to labor other than fair, honorable treatment, and labor owes no duty to capital other than a strict compliance with its contract to do a fair

day's work for fair, honest wages, the duties being mutual, and equality of the parties to the contract unquestioned.

9. The basic elements of wealth have undergone a great change in late years. Honesty, industry and thrift are still regarded as commendable, but wealth in a vast majority of instances, is accumulated by fraud, robbery, chicane and every conceivable form of duplicity. The trusts and syndicates, corporations and monopolies discard honesty. Their industry is exhibited in concocting schemes by which unjust laws are enacted, and just laws evaded, their thrift being theft sustained by a corrupt judiciary, debauched by the hoodle the combines dispense to those who aid in the nefarious work.

10. The capitalists of to-day are chiefly, as in the case of the Vanderbilts, the inheritors of wealth. They never were wage earners, and the laborers of to-day working at wages ranging from 75 cents to \$1 a day during all their days can not hope to become capitalists, as the term is now understood. If under the most favorable conditions they can secure a cottage home and save a few dollars for a rainy day and for old age, the extreme limit of their accumulations is reached. And even this the great majority of capitalists, by their ungodly avarice, seek to jeopardize, and to this fact is to be attributed the labor troubles at Homestead.

11. The laws of nature do not dissipate the "mounds of prosperity," as is shown by the Vanderbilt and the Astor estates, and numerous others that might be named. The state has sought by constitution and statute to aid nature in the work of dissipation, but millionairessdom has found a way to defeat the laws of nature and the statute also.

12. Verily, it is not a crime to acquire property unless it is acquired by crime, as is now being done in the United States, and to an extent that has aroused the attention of Congress and created universal indignation. Workingmen, as a general proposition, are plundered to an extent that life is made one continuous horror.

Finally. Manifestly, all men have an inalienable right to work. But there is another right, and that is, all men have a right to organize unions and to strike if their interests demand it. If A. is receiving \$2 a day, a sum barely sufficient to enable him to support his family decently, and B., a scab, offers to do the work for \$1 a day, A. has a right to resist the wrong. Grant that the effort of A. to maintain his rights requires no assistance from the government, it follows that the government should not order out its military to aid the scab to degrade labor. That is what the government did at Homestead.

There are 20,000,000 wage earners in the United States. Their demands do not exceed a purpose to obtain such wages as will support themselves and those dependent upon them. It is a righteous demand. Will it be granted? Not if the Carnegies and Fricks are able to prevent it. Wealth in such hands is powerful. But 20,000,000 men once aroused will prove more powerful. What will be the result? Time will solve the problem.

#### ENTRE NOUS.

A fallacy sat on a statesman's knee,  
And asked, with a glance askew:  
"What do you think in your heart of me,  
And what am I worth to you?"

The statesman—being alone—spoke free:  
"Don't publish this interview,  
You are worth a great many votes to me,  
But I don't think much of you."

The fallacy hopped from the aged knee,  
And winked as she said adieu:  
"If voters were thinkers and saw through me,  
They would think still less of you."  
—*Pall Mall Budget.*

#### OBJECTIONABLE BOSSES.

The strike in the Brooks Locomotive Works, Dunkirk, N. Y., has now become so serious that an appeal has been made to Buffalo for state troops in case they may be needed. The beginning of the strike was caused a month ago by the refusal of the riveters in the boiler factory to work under certain contractors. President Hinman declined to yield to the demands of the strikers, although twenty-eight men from Philadelphia refused work upon learning they had been brought to replace strikers, and the workmen from Philadelphia at present secured are not able to venture safely outside the works. The lack of riveters had necessitated suspending labor in other departments and now about 600 men are out of employment. Although the emergency may not arise, state troops at Jamestown and Buffalo are reported as being ready to move at a moment's notice.

The foregoing clipping from the *Railway Age* brings into prominence one of the causes which in numerous instances are productive of labor troubles.

It so happens that frequently proprietors of large industries select as overseers of their shops men who, though they may be in some regards competent are in many other respects totally disqualified for the positions they hold. Pig-headed, bigoted and arrogant, they conceive it to be their duty to play the role of guards in penitentiaries or bosses of convict laborers. Their ideas of discipline are not specially dissimilar to those practiced by overseers of negroes in old "plantation times," and though the lash is not used, the attitude of the boss towards the men is that of a petty tyrant, and who, dressed in a little brief authority, exercises it in such a way as to earn the contempt and loathing of the men he seeks to control. He is no more fit for the position than hell would be for a powder magazine, or a chestnut-burr for an eye-stone. Whenever such men are placed in control

of great industries, troubles, more or less damaging to the business, are certain to occur, and though they may not lead to open rupture—to a strike—they are certain to create conditions flagrantly in antagonism to the welfare of those who have their money invested in the industry. To secure the best work, workingmen must be treated as men and not as menials, as slaves—and when the overbearing methods of the boss can no longer be endured, a strike is inevitable and is just and honorable. Indeed, it is the last resort of men who have a spark of self-respect to assert their manhood. The principle involved is a dear one, and for its recognition workingmen have the right to resort to extreme measures.

#### Progress and Poverty.

MR. EDITOR:—It requires no lengthy argument to establish the fact that there is a surplus of engineers and firemen in this country to-day; it will not be necessary for me to go into details to prove this assertion, as a great number of our members are painfully aware of its truth already. The material cause of this state of affairs is too many promotions; the formal cause, seniority; and the efficient cause, the stupidity and ignorance of the Brotherhood of Locomotive Engineers. The crowd of success-worshippers who compose the conventions of the B. L. E., principally passenger engineers who have good runs, are too busy in their eagerness to toady after P. M. Arthur to have a thought about enacting any legislation favorable to their unfortunate brothers who are out of employment, quite often through no fault of their own. About two weeks ago the bricklayers in Chicago presented a new schedule; they wanted 50 cents an hour, whereupon their employers suggested that they submit their grievances to an arbitrator. They did so and the arbitrator decided in their favor. So the contractors gracefully complied with their demand, and shortly afterwards appeared in public print explaining how delighted they were with the settlement. Within the past month the carpenters of Chicago have, also, had a difference with their employers. The contractors attempted to cut the scale—35 cents an hour—believing that they could obtain plenty of help from the vast army of unemployed wintering in Chicago, so they refused to honor the schedule in force and thereby precipitated a strike. In view of the vast number of idle men in Chicago, estimated at several hundred thousand, everybody predicted defeat for the men, and it came as a great surprise when they won the strike inside of three days. In the same papers describing the victories of the Chicago bricklayers and carpenters there appeared a dispatch relating how the great body of engineers and firemen on the N. P. R. R. had suf-

fered a reduction in wages, and they are only one of many, as ten or fifteen different railroad companies have reduced wages in the past six months. When the Brotherhoods of Engineers and Firemen did make a stand, when they walked out on the Lehigh Valley, every one knows that they were defeated; and the greatest factor entering into that defeat was the unusually large number of engineers and firemen who were glad to obtain employment at any wages. Does not the comparison appear startling? Does not it strike a person with overwhelming force that something must be radically wrong when a bricklayer and a carpenter can obtain better wages than a locomotive engineer, with all his boasted skill, besides working shorter hours and feeling more secure in the knowledge that he can lose his situation to-day and secure another equally as good to-morrow? It requires no great skill to be a carpenter. I have seen men who never displayed any great genius become carpenters after an apprenticeship of six months, while two years is the prescribed period for a man to learn bricklaying. Let us examine the methods and policies of the bricklayers' and carpenters' organizations. And also the policy of the Brotherhood of Locomotive Engineers. Possibly we may learn why the condition of their members is in such startling contrast to-day.

When the bricklayers' union was organized, they took the broad and liberal ground that a man or boy who was fit to work with them was also fit to associate with them in an effort to have their grievances redressed, he was worthy to counsel with them and receive their advice and assistance, even if he was only an apprentice. When an injustice was committed against an apprentice the bricklayers took it up. If he was discharged by a contractor when his indenture as an apprentice had almost expired, they saw that he secured employment with another contractor and that he was promoted to the position of a journeyman when he was entitled to it. When a selfish apprentice attempted to jump out and become a journeyman before his allotted time, to the exclusion of older and more experienced men who might be in search of employment, the union put a quietus on him. No useless or long-winded arguments were wasted on him, but he was brought to time in a hurry, and he had no junior organization to back him up in his selfishness. In the spring of '87 the Contractor's Alliance in Chicago determined to reduce wages and increase the hours of labor from 8 to 10. On this issue the bricklayers locked horns with their employers, and there followed one of the bitterest battles, lasting five months that ever occurred between capital and labor. But thanks to the superb organization of the bricklayers, they won, and since that mem-

orable struggle no contractor has ever invited a strike; differences have arisen between employers and employes, but they have always been settled by arbitration, and invariably in favor of the men. To-day, the bricklayers' union in Chicago is the most prosperous labor union in America. It owns a handsome brick block worth hundreds of thousands of dollars, which nets a handsome rental that forms a fund to protect against misfortune in their old age the men of brains who conceived and perfected such a grand organization. The history of the carpenters' organization in Chicago is similar to that of the bricklayers'; they admitted apprentices to their union, and then they federated. They made no senseless speeches about a three dollar a day man having nothing in common with a dollar and a half a day man, they federated with every other organization engaged in the building trades. Hodcarriers, bricklayers, steam-fitters, plasterers, everyone, nobody barred. Several years ago when they demanded a uniform rate of wages, 35 cents an hour, the contractors demurred, but after a hard struggle the men won, and victory once more perched on the banner of progress. Then some of the contractors artfully offered some of the older men as high as 60 cents an hour. They said to them "you are doing yourselves an injustice to place your skill on a level with these fresh fish," well knowing that if they could create classes among the men their union would soon go glimmering. But the carpenters were not to be caught by any such cheap trick; they declined all such tempting offers, and high upon the scroll of progress, to-day, is inscribed the name of the United Carpenters' Council of Chicago. How different has been the policy of the B. L. E. They have rejected with scorn all overtures from their apprentices for a close affiliation of their respective interests. They have persistently refused to federate with their sister railroad organizations, and their grand officers have gone about the country boastfully asserting, and writing magazine articles, to the effect that the B. L. E. stood aloof from all other labor organizations, and formed the "aristocracy" of the American workingmen. The less a man knows the more susceptible he is to flattery, therefore, when Chauncey Depew and other railroad magnates flattered the leaders of the B. L. E., and told them what extraordinary skill it took to run a locomotive, and how the engineers ought not lower their dignity by associating with the common herd, it found a ready response in their hearts. Unlike the carpenters they were too obtuse to see through the small confidence game that those polished arch-enemies of labor played on them, so they swallowed the bait, hook and all, and cried for more. The poor firemen who had been scorned and ridiculed

by the skilled (?) engineers found a brotherhood of their own, which has grown into a young David that will soon slay the giant, Goliath, with his little sling shot—Seniority. It is a well known fact that there is a silent but bitter struggle going on between the B. L. E. and the B. L. F., and the B. L. F. is slowly but surely getting the best of it. Members of the B. L. E. are dropping out of the service every day to swell the ever increasing ranks of the unemployed, and B. L. F. men are being promoted to fill their vacant places. Already there are ten thousand such men in the ranks of the B. L. F., who have been promoted to the position of engineer, and who show their disapproval of the B. L. E. by refusing to join it. Its policy has been that of poverty, poverty of ideas, poverty of execution, and poverty of good results. The two contrasted policies are a clever exemplification of the terms, progress and poverty. The bricklayers' and carpenters' organizations are progressive to an unusual degree, while the B. L. E. has gone to the other extreme. It has exhibited a poverty of brains that would have warranted an investigation as to its sanity years ago, were it an individual instead of an organization. This poverty of brains was strikingly illustrated during the Lehigh Valley strike. According to report, the grand officers of the B. L. E. called on the officials, and their dignity was insulted; so a strike was ordered at once. The men had been working under these conditions for years and nothing was thought of it. According to the laws of the B. L. E., a two-thirds vote, favoring a strike, of the members employed on the system was necessary before a strike could be ordered. This was not cast. It lacked fifteen of the required number. But a little thing like that did not prevent a strike being ordered, when their dignity had been offended, and nothing but blood would wash the insult out, so the men were ordered out. Now the strike has been declared illegal, and every hard working member who went down in his jeans for five dollars to pay the Lehigh assessment can console himself with the reflection that it was a contribution to the ignorance of the grand officers, and every engineer who lost his position can reflect on the proposition that his means of earning a livelihood was sacrificed on the altar of a grand officer's wounded dignity. That it was wounded pride and dignity they were striking for instead of bread and butter is conclusively proved by the settlement; as soon as the grand officers' grievances were settled, by President Wilbur granting them recognition, the strike was declared off; and the men were smilingly told: "If you can't get what you want take what you can get." Were I to declare that all members of the B. L. E. were poverty stricken in the upper story, I would do thousands of them an in-

justice, for there are countless numbers of them who are broad-minded, liberal and progressive. On the other hand, there are members who are as narrow-minded as P. M. Arthur ever dared to be. But I am not speaking of individuals, I am speaking of organizations, and the point I seek to make is that the B. L. E. is the most illiberal, narrow, contracted, useless institution that ever burlesqued a labor organization, and its policy for the past five years has been as barren of good results as the Sahara desert is of vegetation. If its policy of exclusiveness is correct, then the war of the Rebellion was a failure, for it was fought on the assumption by the Confederate states that the diversified interests of this country could not be successfully managed by one nation. If the policy of the United States is right then the engineers' policy is a mistaken one, for the two policies are directly opposed, therefore, both cannot be correct. But while the B. L. F. is besting the B. L. E. it is also beating itself; its triumph will prove a boomerang that will eventually react upon it and destroy it. For through the seniority system of promotion it is unconsciously assisting the railroad companies to flood the country with idle engineers and firemen. No shame should attach to the B. L. F. that such a condition of affairs exists. Its conduct has been manly and consistent throughout. It has held out the olive branch of peace to the B. L. E., only to have it scornfully rejected and the fight forced on the basis of "your life or mine," so in self-defense it was forced to accept the challenge, and as a result the B. L. E. is dying of dry rot to-day.

Had the B. L. E. profited by the C. B. & Q. strike, had they taken warning from the disastrous rout, as any body of men with sense would have done, consolidated with the B. L. F., and elected Frank P. Sargent grand chief, the country would not be flooded with idle engineers and firemen to-day, nor would the companies be so eager to reduce wages. As the calling of the locomotive engineer has been well nigh ruined by the blundering methods of the B. L. E., and as it has proven itself wholly incompetent to deal with the question, I suggest that the ten thousand engineers in the B. L. F., in co-operation with the firemen, call a halt and take the settlement of the question into their own hands. Then the B. L. E. will fall in line later on, as it usually does, for, like the Chinese, it can imitate but can not initiate. Let it be settled on a plane of equal justice to all, from the lowest to the highest, and believing it would give satisfaction to all, I submit the following:

ARTICLE I. Whenever there exists a vacancy for an engineer, the oldest fireman shall be promoted providing he has fired five years, if not, hire an experienced engineer.

ART. 2. Hire an experienced fireman for every green man hired.

ART. 3. No engineer shall be assisted to secure a job unless he has had at least three years' experience as such, and no fireman who has had less than one year's experience.

ART. 4. No engineer shall earn more than \$125 in any one month.

At first glance this may appear impracticable; but before it is condemned let me cite an instance of how a trunk line lately secured a number of engineers to the detriment of all idle engineers, also how they might have been obtained, under the execution of the plan submitted, to the corresponding profit of the idle engineers and firemen. First, they promoted eight firemen who had fired long enough to entitle them to a job of running, then ten men were hired who had a "pull." Then they were taken sudden, and promoted forty men, some of whom had not fired long enough to be eligible to the B. L. F. In the meantime, they hired about fifty raw recruits, and the engineers took them out, instructed them in their duties, and declared they were "good men." Within six months thirty engineers had been discharged, principally promoted men. To sum it up, ten engineers had been hired and thirty discharged. Thirty minus ten leaves a loss of twenty on the engineers side of the ledger. So the rush of business on this division, instead of being a gain, was a positive loss to the men as it only served to send twenty more engineers in search of work. Suppose the plan suggested above was in operation, and it could have been, had engineers and firemen united in a demand for it. First, those eight old firemen would have been promoted. Then fifty instead of ten, men would have been hired. Next, the company would have hired twenty-five experienced firemen instead of hiring all green men. Result; seventy-five experienced men would have found profitable employment, which number added to the surplus of twenty that was actually created, would make a grand total of 95 in favor of the men. Ninety-five men on one division of one system would soon reduce the surplus, and this is the best way to work off the surplus. The tendency of the times is towards consolidation. Every time a trunk line gobbles up a small road let this plan be put in practice, and its good effects will soon become apparent. The plan of promoting two men and hiring one is impracticable, and will never work for this reason: first, you must have it adopted universally, as the firemen on a few systems will never consent to having their roads made a dumping ground for all the idle engineers in the country; and its adoption will never become universal for the reason that on too many roads, nowadays, a fireman must fire from five to ten years before it comes his turn for promotion, and he will object to any change that will lengthen this term of service from three to five years more. Under the plan I have

submitted, old firemen would not be interested with at all. When they have fired five or six years they have earned as clear a title to the position of an engineer as a majority of the engineers of to-day. None of them went to college to learn how to run an engine, and there are any number of them who never fired an engine three years, not to talk of five. Too often has it happened that some farmer has got a job firing on some one horse pike and been promoted in a year or two, run long enough to join the B. L. E., and went over on a good road and got a job of running in preference to men who had fired a locomotive before he knew what a locomotive was, and they had to show him how to run his engine. Those are the kind of men who strut around and talk about those "yellow-hammers who are looking for promotion while good men are idle." Article three will rule out this class, also those "accidents" who have run just long enough to prove that they don't know how to run an engine. No fireman should be asked to lay back and give an engineer a job running unless he can show at least three years' experience. As a general proposition, it can be stated that any man who has been an engineer three years is a competent man, while a man who has only run six months or a year, and then been discharged, is not an engineer in the proper acceptance of the term. The ideas embodied in W. H. Miller's article in the *March Magazine*, with reference to having all engineers pass a strict examination similar to that passed by marine engineers, are excellent, and if adopted could not fail to produce good results. Article four covers the case of those men who do the work of two, and in some instances three men, earning as high as \$300 per month, and then talk about firemen crowding engineers out of employment! Consistency, thou art a jewel! The only way these reforms will ever be accomplished, is by the engineers and firemen standing shoulder to shoulder in one organization, and insisting upon them with all their united strength. The most direct way to such a consummation would be for all engineers to join the American Railway Union. Its preamble declares war on the present method of promotion, and its policy is progressive—it admits all engineers. Right here I wish to inquire why it would not be a distinct step in advance, and in line with progress, for all members of the B. L. F. to join the American Railway Union? Like Brutus, "I pause for a reply."

HUNTINGTON, Md.

*James Deegan.*

KENTUCKY is the foremost state in the production of hemp and has been known to produce 35,000 tons in a year. It produces nearly two-thirds of the American tobacco crop, growing in 1889 280,000,000 pounds.

### The Alley "L" and Organized Labor.

MR. EDITOR:—In the city of Chicago, county of Cook, there is a little stilted railroad about eight miles long which is known as the South Side Rapid Transit Elevated Railroad. Title enough, eh? Well, to put it mildly, the managements—and there have been two managements since the road was put in operation, less than two years ago—treatment of the enginemen in its employ has been shameful, rotten! In November, '93, about a dozen or more employes, realizing the necessity for organization, got together and sought to federate the force without regard to what department a man might be employed in. Result: Seven enginemen and three trainmen summoned before a so called court of inquiry, composed of men who were ready to do the bidding of the president and general manager, right or wrong. A farcical trial was given the men, and this court of subsidized subordinates, with the assistance of testimony given by two subsidized traitors from the ranks of the men, promptly found the seven enginemen guilty of working against the best interests of the company and recommended their discharge from the service, which recommendation was speedily acted upon. The trainmen were ordered reinstated, which, I think, proves conclusively that the fight was to be made against the two great brotherhoods. Now, in the face of this, the management wanted to be placed on record as being particularly friendly to organized labor! On the second day of January, 1893, Compound Lodge 499, B. of L. F., was organized with ten charter members. On the 25th day of January, 1893, a new schedule was put into operation on the stilted road with disastrous results to 499. Why? Well, out of the ten members, eight found themselves out of situations, in midwinter and in a strange city. But, worst of all, the majority of these had families dependent on them, and, furthermore, they had brought their families to Chicago from distant places, at the expense of almost everything they had in the way of worldly goods. You will say that they were foolish for not waiting to see how things were going to pan out before moving their families to Chicago. But the management, in almost every instance, gave assurances of permanent employment at first-class wages. Were these men discharged because, in making a reduction of the force, they were found to be the least competent enginemen? No, most decidedly not. The majority of them had a good hard coal record to refer to—hard coal being the fuel used—while a goodly number of those retained had experience only in burning soft coal. I state this fact merely to prove that these men were not discharged for incompetency, and not with any intention of making invidious compari-

son between the men. The mere fact of their having had the temerity to organize was considered sufficient cause for their dismissal. To emphasize the fact that organized labor had no place and could expect no quarter on his road, the general manager refused to treat with a committee of the discharged enginemen. We carried our grievance to our nearest grand officer, Bro. Hannahan, at once; and he, in that inimitable style which is all his own, brought Dr. Barnard to an understanding of the fact that it was best to accord us an audience, which he did at once. Dr. Barnard began an explanation of why he dropped the men he did that would do credit to none but the most driveling idiot in Bloomingdale asylum. To show you the calibre of the man: He wouldn't allow the door of his private office to be closed while entertaining the committee, but kept it wide open and had one of his cheap heelers stationed right outside ready to come to his assistance whenever he most certainly feared they would—the committee should attempt to assault him. Picture to yourself a committee composed of ten or twelve healthy, vigorous enginemen assaulting a man who weighed less than 100 pounds, and who was apparently in the last stages of a pulmonary complaint. Can you imagine anything more ridiculous or improbable? Still, this representative of corporate greed had the audacity and narrowness to size up that body of splendid men in just that way, simply because they were representatives of organized labor. Dr. Barnard's explanation: "Gentlemen, I am willing to acknowledge that I may have made a mistake in dropping the men I have and retaining those I did, but I did it in accordance with my best lights on the subject." Now, mark you what those lights were. "On a certain day I told Mr. Thompson (Supervisor of engines) that I would be glad to have him dine with me at my house. After dinner I said 'Mr Thompson, what is your opinion of Mr. So and So as an engineman?' This opinion I at once put down in short hand. 'Now, Mr. Thompson, what is your opinion of Mr. Someone-else as an engineman?' This opinion I recorded in the same way. I pursued the same plan with all my subordinate officers, being careful to always put each opinion down in short hand so that one man's opinion would not influence another's." Here the doctor rubbed his hands together gleefully, and chuckled. Grand idea! "When I had the opinions of all my subordinate officers in, and I can assure you, gentlemen, that it required considerable diplomacy on my part to get them to express their opinions in their great fear that they might do someone an injury. I summed up the whole and the men securing the best average were retained; the others, I am sorry to say, let

go. But, mind you, you are not discharged, but simply dropped for lack of room for you at the present time. And furthermore, gentlemen, if I can assist you in any way, even if it necessitates the taking off of my coat and walking ten miles, invalid though I am, I will gladly do it."

Buncombe! Hypocrite and liar? Well, I should say so. Why, the man had an agent, then, in New York City endeavoring to induce men to come here. You will naturally ask, how did this man's mind become so bitterly poisoned against organized labor? I will tell you. This man Thompson, got his baleful hooks in on the half dead and feeble-minded old man, and influenced him against every man whom he had the least personal feeling against; and I can assure you that the major part of them were members of the brotherhoods—he having been summarily ejected from the B. of L. E. He once said to a man who had on a B. of L. E. pin, "What is that the emblem of, the brotherhood of rag pickers?" This man Thompson has left behind him a trail from which a stench arises like that of a skunk. Chased off the Manhattan "L," brick battled off of the New York Central, and fired bodily from the D. L. & W., is a short history of his career since he landed on our too hospitable shores. But a just retribution has overtaken Dr. Barnard and his horde of unprincipled sycophants. Their official heads have dropped into the basket and for the good of organized labor, may they stay there.

Has the new management benefited the enginemen any? Yes and no. Yes, from the act that there are no more men of Thompson's ilk countenanced. And no, from the fact that they have increased the hours of labor and reduced wages. In connection with the reduction of wages and increase of hours, I will tell you about contracts that were sent around to be signed by the servants of the company. These contracts were for three years, and the minimum wage for engineers was to be three and a half dollars per day, while that of fireman was to be two dollars and twenty-five cents. The maximum wage of an engineer was to be four and a half dollars per day, and that of a fireman two dollars and seventy-five cents per day; the above to be determined by length of service. Well, all went on smoothly until it came time to increase wages; then the new management showed its fine Italian hand. By specious promises of letting the wages remain at three and a half dollars and two dollars and twenty-five cents respectively, while eight hours was to constitute a day's work, they humbugged the most of the men into giving up their contracts. How near do they live up to the above promise? About as near as greedy corporations generally do, by totally ignor-

ing it six months after making it.

Do you know what ten or eleven hours mean on an elevated engine? Well, I'll tell you. It is equivalent to about thirty hours on a surface road. Oh, you may laugh, but I'll tell you that from the moment you step onto your machine until you dismount to go home, it is all work. Stop and start is the order of the day from start to finish. And, I'll tell you, many is the poor aching back that can bear eloquent testimony against anything more than eight hours. Do the enginemen rest easy under the yoke of corporate greed and injustice? No, emphatically No! But thanks to their intelligence and thoughtfulness for others dependent upon them for support, they swallow their wrath and, like manly men that they are, bide their time. Brothers, our only salvation is in federation. Let us federate!

CHICAGO, ILL.

F. A. McLaughlin.

### The Anarchists of Chicago.

MR. EDITOR:—In all that has been said in these columns concerning anarchy and anarchists, there has been no attempt to define the terms or to use them in any other than their commonly accepted sense. And yet, the commonly accepted definition of anarchism is quite different from its actual meaning when considered as a social theory. It is commonly supposed that to be an anarchist one must be a dynamiter, an assassin, and a thief. This, however, is not correct. Nearly all anarchists condemn violence. They believe in the dissemination of ideas as the only means by which their principles will be adopted, and they hold that a resort to violence would only arouse the prejudices and passions of the people and close their minds against a fair consideration of their theories. Violence, as a means of accomplishing ends, is a method which no school of thought can lay exclusive claim to and for which no school can be particularly condemned. Prohibitionists, as well as anarchists, have resorted to the use of dynamite to enforce their principles, and the democrat and republican, as well as the socialist and communist, have not hesitated to employ the bullet as a substitute for the ballot whenever it has suited their purpose to do so. We have, therefore, no more right to enter into an indiscriminate condemnation of anarchy because certain fanatical adherents of that theory have resorted to violence to attain their ends, than we have to indiscriminately condemn Christianity because, as has frequently been the case, certain fanatical Christians have committed murder and other grave crimes, as a means of fulfilling their conceptions of the Christian theory. Anarchism, as a social theory,

may be defined by the following passages from Mr. John Henry Mackey's book, "The Anarchist:—

"All government is based upon force. But wherever there is force there is injustice."

"Liberty alone is just; the absence of all force and all coercion. Equality of opportunities for all constitutes its basis."

"On this basis of equal opportunities, the free, independent, sovereign individual whose only claim on society is that it shall respect his liberty, and whose only self-given law consists in respecting the liberty of others—that is the ideal of anarchy."

"When the resources of nature shall no longer be obstructed by the violent arrangements of an unnatural government which is a mockery on all common sense, and which, under the pretense of the care of the general welfare, purchases the mad luxury of an insignificant minority at the cost of the misery of an entire population, then only shall we see how bountiful she is, our mother. Then will the welfare of the individual in truth have become identical with the welfare of the community, but instead of sacrificing himself to it, he will have subjected it to himself."

"For it is this and nothing else that anarchism wants: The removal of all artificial obstructions which past centuries have piled up between man and his liberty, between man and his intercourse with his fellow-men, always and everywhere in the forms of communism, and always and everywhere on the basis of that colossal lie, designed by some in shrewd and yet so stupid self-infatuation, and accepted by others in equally stupid self-abasement; that the individual does not live for himself but for mankind!"

However, the commonly accepted definition of anarchy is something quite different. Those who express by their acts a contempt or disobedience of existing law, those who promote "disorder in a state," are, in the commonly accepted definition of the term, anarchists; and a society where "the laws are not efficient, and individuals do what they please with impunity," is in a state of anarchy. An anarchist, then, may be one who knows nothing about anarchy as a social theory, or who, knowing something of the theory, utterly condemns it. He is one who, while fully accepting the institution of government and its existing laws as right and just, deliberately breaks those laws and brings government and its machinery for enforcing order into contempt. He is one who, though in many cases sworn to enforce and execute the law as it exists, deliberately breaks his oath and does what he pleases with impunity, in spite of the law. He "promotes disorder in a state" by prostituting the law and bringing it into contempt. There are many of these sort of anarchists in the country and Chicago has its full quota, and it may be observed that these anarchists are the most dangerous enemies to the present order that exists to-day. Editor Stead, in his new book, "If Christ Came to Chicago," presents some interesting word-pictures of these Chicago anarchists that are worth pondering. Speaking of the courts, upon which the citizens rely to obtain justice, he says: "Almost every principle of sound jurisprudence is violated every day in the justices' courts, both civil and criminal.

Justices nominated for political considerations and swayed more or less shamelessly by partisan feelings, set before the lawless members of the community a shameful object lesson in injustice and corruption." There is hardly a court in Chicago where a prisoner who has a political pull is not tolerably certain of escaping punishment, unless, of course, his crime has been too flagrant or too sensational for it to be safe for him to be liberated after the usual fashion. The political machine of Chicago is described as a "picture of bribery, intimidation, bull-dozing, knifing, shooting, and the whole swimming in whiskey." The taxing machinery of the city is but a gigantic engine for the robbery of the poor. The assessors are all official perjurers. Speaking of them: "Whatever may be the cause, there is a heavier sum in solid dollars pocketed every year by the official perjurers in Chicago than is paid to any other officials in the service of the city."

\* \* \* There will be a poor lookout for the town assessors of the city of Chicago when they stand before God to render account. For each and all of the whole 11 of them are false swearers." As a result of the assessor's contempt for law, twenty years ago Chicago was assessed on real and personal property to the amount of \$312,072,995, but in 1893 the amount was only \$245,790,351; thus showing a shrinkage in value of \$66,282,644 in twenty years. This is in the face of the law that provides that "property shall be assessed at its fair cash value, estimated at the price it would bring at a fair voluntary sale." The assessors take an oath to enforce the law. In failing to do so they are perjurers. They are more than this. In the common acceptance of the term, they are anarchists. On the authority of the *Chicago Times*, Chicago's assessment to-day, under the provisions of the law, ought to be not far from \$2,000,000,000, yet it is but little more than ten per cent. of that sum. But where the great evil of this perjury and contempt of law appears is in the fact that it operates for the exclusive benefit of the rich. If property-holders were all assessed at the same rate there would be no great harm springing from this evasion of the law other than that connected with abstract considerations of morality, but the law is broken in the interests of the rich and the burdens of the poor are increased proportionately. Mr. Stead shows that the personal property in the mansion of the great street railroad magnate, C. T. Yerkes, is only valued at \$1,000. The millionaires, J. W. Doane, Marshall Field, Marshall Field, Jr. and G. M. Pullman pay only \$20 assessment for their horses, \$30 each for carriages, and so on. The assessors, under oath, return as the personalty of leading citizens these

figures: Marshall Field, \$20,000; Marshall Field, Jr., \$2,000; P. D. Armour, \$5,000; George M. Pullman, \$12,000; J. W. Doane, \$10,000; H. H. Kohlsaat, \$1,500; C. T. Yerkes, \$4,000; Potter Palmer, \$15,000. Mr. Stead says: "None of these gentlemen make out their own returns. They prefer the unerring judgment and trained experience of the assessor. He stands between them and their conscience. \* \* \* It is, in plain English, a colossal lie, bolstered up by habitual perjury, and operating to produce roguery of every kind. An assessor has practically *carte blanche* to steal where he pleases. Nor is there any possibility of any check upon his corruption, provided he acts with ordinary caution. The reform of the assessment system can only be effected by action at Springfield through the state legislature, and this brings another difficulty. Even if you were to reform the city council of Chicago and get them unanimously to indorse a bill reforming the assessment system, it would have no chance at Springfield. The rich, who at the present moment escape their fair share of the burdens of the city, would simply go down to Springfield and buy up the legislature. Congressmen are not only a more disreputable lot than the aldermen, but their price is much lower. You can buy up the legislature of Illinois at much less per head than you can the city council of Chicago."

\* \* \* I can only say, for my own part. I marvel with exceeding great wonderment that a system so rotten and so unjust could be allowed to continue for a quarter of a century in the midst of a nominally Christian community." The *Chicago Times* publishes an interview with postmaster Helling on this subject, in which he says: "There is a business man in this town whose taxes amounted to \$1,500. He was going to pay that sum without a kick. One day a man went to him and said: 'Your taxes are \$1,500. I can get them cut to \$750. What will you give me if I do this?' After some talk the business man agreed to give \$400. His taxes were reduced and he saved \$350. The city was cheated out of \$750. That is only one case. There are scores of others. Of the \$400 bribe the assessor got \$200 and his agent \$200. There are men in the city of Chicago whose business it is to swear to lies, to perjure themselves. A merchant does not like the idea of going on record as a perjurer. So he says to one of these professionals: 'Here, I am going out of town. You fix up my taxes. Make the amount so much,' naming the small sum on which he wants to be assessed. The perjurer does this and gets his price."

The *Times* cites two instances in the article quoted from showing how the poor man is compelled to bear the burdens of government, while the rich, through col-

lusion and perjury, are exempt: "The Ashland block is one of Chicago's most noted sky-scrapers. The ground on which it stands is valued at more than \$500,000. The building, which was completed two years ago, cost more than \$1,000,000. The building and lot of ground upon which it stands could not be bought for less than \$2,000,000. The lowest cash valuation is placed at \$1,800,000. Yet it is assessed at \$153,000! Only one twelfth of its actual value. As it is, the owner or owners of the building have evaded payment of taxes on \$1,650,000.

James McCombie is the owner of a small piece of property at the northwest corner of State and Twenty-fifth streets. The corner building is a two story brick about forty feet wide and sixty feet deep. This is rented out by Mr. McCombie. The next building north is a small wooden structure, two stories high, twenty feet wide and fifty feet deep. In this the owner has a small tobacco and notion store in the front and he and his family live in the rear. Twenty years ago Mr. McCombie put up these two buildings at a cost of less than \$10,000. They are not worth half that much to-day. Mr. McCombie is not a rich man, and yet his taxes on this small property, which he gained by years of hard toil, are \$382.81. The fair value at voluntary sale of the little frame store occupied by Mr. McCombie is about \$2,500, yet the assessed valuation is \$1,743. In other words, Mr. McCombie, who is a poor man, is assessed at seventy per cent. of the value of his property, while the millionaire owners of the Ashland block are assessed but twelve per cent. of the value of their money-making investment. The cradle of anarchy is rocked by such discriminating hands as these."

Speaking further of these unjust conditions, the *Times* says: "If the poor citizen resents the injustice, he is called an anarchist or a socialist and an additional tax is laid upon his little home and his cow to support an additional regiment of militia to shoot down such wretches as he."

Remember, this is in Chicago, where "our fair-minded Judge Gary is to sit on the bench again," and where it is going to "fare very badly with anarchists and all such law breakers." To enter into an exhaustive review of Mr. Stead's book would occupy too much space. That portion referring to the tax dodger I have dwelt upon because it is corroborated by the articles in the *Chicago Times*, and it will enable one, if he is so inclined, to put his fingers on the real anarchists of Chicago. In the commonly accepted definition of the term, the assessors of Chicago are anarchists; they take oath to obey the law, and execute the law, and they habitually perjure themselves for a consideration. They bring the law into

contempt. The millionaires, the Fields, the Armours, the Pullmans, *et id genus omne*, are also anarchists. They are guilty of perjury and subornation of perjury. They hold the law in contempt, and their actions are calculated to "promote disorder in a state." Is it much wonder that thinking men should turn from the contemplation of anarchy of this description to the contemplation of anarchy as a social theory? If the citizens of Chicago have a consuming desire to stamp out anarchy, they must devote their attention to the doings of those anarchists who are masquerading in the guise of archists.

W. P. Borland.

BAY CITY, MICH.

### Nero in the Circus.

As an artist Nero would have made the fortune of a dozen concert halls. Fancy the attraction—an emperor before the foot-lights; but fancy the boredom also. The joy at the announcement of his first appearance was so great that thanks were offered to the gods, and the verses he was to sing, graven in gold, were dedicated to the Capitoline Jove. The joy was brief. The exits of the theatre were closed. It was treason to attempt to leave. People pretended to be dead, in order to be carried out, and well they might. The star was a fat man with a husky tenorino voice, who sang drunk and half naked to a protecting claque of ten thousand hands.

But it was in the circus that Nero was at his best; there no matter though he were last in the race, it was to him the palm was awarded, or rather it was he that awarded the palm to himself, and then quite magnificently shouted, "Nero, Caesar, victor in the race, gives his crown to the people of Rome!"

On the stage he had no rivals, and by chance did one appear, he was invited to die. In that respect he was artistically susceptible. When he turned acrobat, the statues of former victors were tossed in the latrine. Yet as competitors were needed, and, moreover, all emperor that he was, as he, singly, could fill neither a stage nor a track, it was the nobility of Rome that he ordered to appear with him. The nobility was willing enough to appear, only there were few that cared to be forced, and for this command the unforgiving nobility never forgave him. On the other hand, the proletariat loved him all the better. What greater salve could it have than the sight of the conquerors of the world entertaining the conquered, lords amusing their lackeys?

Greece meanwhile sent him crowns and prayers; crowns for anticipated victories, prayers that he would come and win them. Homage so delicate was not to be disdained.

Nero set forth, an army at his heels; a legion of claqueurs, a phalanx of musicians, cohorts of comedians, and with these for retinue, through sacred groves that Homer knew, through intervalles which Hesiod sang, through a year of festivals he wandered, always victorious. It was he who conquered at Olympia; it was he who conquered at Corinth. No one could withstand him. Alone in history he won in every game, and with eighteen hundred crowns as trophies of war he repeated Caesar's triumph. In a robe immaterial as a moonbeam, the Olympian wreath on his curls, the Isthmian laurel in his hand, his army behind him, the clown that was Emperor entered Rome. Victims were immolated as he passed, the Via Sacra was strewn with saffron, the day was rent with acclaiming shouts. Throughout the empire sacrifices were ordered. Old people that lived in the country fancied him, Philostratus says, the conqueror of new nations, and sacrificed with delight.

But if as artist he bored everybody to death, he was yet an admirable impresario. The spectacles he gave were unique. At one which was held in the Taurian amphitheater it must have been delightful to assist. Fancy eighty thousand people on ascending galleries, protected from the sun by a canopy of spangled silk; an arena three acres large, carpeted with sand, cinnabar and borax, and in that arena death in every form, on those galleries colossal delight.

The lowest gallery, immediately above the arena, was a wide terrace where the Senate sat. There were the dignitaries of the empire, and with them priests in their sacerdotal robes; vestals in linen, their hair arranged in the six braids that were symbolic of virginity; swarms of oriental princes, rainbows of foreign ambassadors; and in the center, the imperial pulvinar, an inclosed pavilion, in which Nero lounged, a mignon at his feet.

In the gallery above were the necklaced knights, their tunics bordered with the augusticlave, their deep blue cloaks fastened to the shoulder; and there, too, in their wide white togas, were the citizens of Rome.

Still higher the people sat. In the top-most gallery were the women, and in a separate inclosure a thousand musicians answered the cries of the multitude with the blare and the laugh of brass.

Beneath the terraces, behind the barred doors that punctuated the marble walls which circled the arena, were Mauritanian panthers that had been entrapped with rotten meat; hippopotami from Sals, lured by the smell of carrots into pits; the rhinoceros of Gaul, taken with the net; lions lassoed in the deserts; Lucanian bears, Spanish bulls; and, in remoter dens, men unarmed, that waited.

By way of foretaste for better things, a handful of criminal, lo! al desperadoes, an impertinent slave, a machinist, who in a theater the night before had missed an effect—these, together with a negligent usher, were tossed one after the other naked into the ring and bound to a scaffold that surmounted a miniature hill. At a signal the scaffold fell, the hill crumbled, and from it a few hyenas issued, who indolently devoured their prey.

With this for prelude, the gods avenged and justice appeased, a rhinoceros ambled that way, stimulated from behind by the point of a spear; and in a moment the hyenas were disemboweled, their legs quivering in the air. Throughout the arena other beasts, tied together with long cords, quarreled in couples; there was the bellow of bulls, and the moan of leopards tearing at their flesh, a flight of stags, and the long clean spring of the panther.

Presently the arena was cleared, the sand re-raked and the Bestiarii advanced—Sarmatians, nourished on mares' milk; Sicambrians, their hair done up in chignons; horsemen from Thessaly, Ethiopian warriors, Parthian archers, huntsmen from the steppes, their different idioms uniting in a single cry—"Caesar, we salute you." The sunlight filtering through the spangled canopy chequered their tunics with burning spots, danced on their spears and helmets, dazzled the spectators' eyes. From above descended the caresses of flutes; the air was sweet with perfumes, alive with multicolored notes; the terraces were partures of blending hues, and into that splendor a hundred lions, their tasseled tails sweeping the sand, entered obliquely.

The mob of the Bestiarii had gone. In the middle of the arena a band of Ethiopians, armed with arrows, knives and spears, knelt, their oiled black breasts uncovered.

Leisurely the lions turned their huge, intrepid heads; to their jaws wide creases came. There was a glitter of fangs, a shiver that moved the mane, a flight of arrows, mounting murmurs, the crouch of beasts preparing to spring, a deafening roar, and, abruptly, a tumultuous mass, the suddenness of knives, the snap of bones, the cry of the agonized, the fury of beasts transfixed, the shrieks of the mangled, a combat hand to fang, from which lions fell back, their jaws torn asunder, while others retreated, a black body swaying between their terrible teeth, and, insensibly, a descending quiet.

At once there was an eruption of bellowing elephants, painted and trained for slaughter, that trampled on wounded and dead. At a call from a keeper the elephants disappeared. There was a rush of mules and slaves; the carcasses and corpses vanished, the toilet of the ring was made; and then came a plunge of bulls, mists of vapor

about their long, straight horns, their, anxious eyes dilated. Beyond was a troop of Thessalians. For a moment the bulls snorted, pawing the sand with their fore feet, as though trying to remember what they were doing there. Yet instantly they seemed to know, and, with lowered heads, they plunged on the point of spears. But no matter, horses went down by the hundred; and as the bulls tired of goring the dead, they fought each other; fought rancorously, fought until weariness overtook them, and surviving Thessalians leaped upon their backs, twisted their horns, and threw them down, a sword through their throbbing throats.

Successively the arena was occupied by bears, by panthers, by dogs trained for the chase, by hunters and hunted. But the episode of the morning was a dash of wild elephants, attacked on either side; a moment of sheer delight, in which the hunters were tossed up on the terraces, tossed back again by the spectators, and trampled to death.

With that for bouquet the first part of the performance was at an end. By way of interlude, the ring was peopled with acrobats who flew up in the air like birds, formed pyramids together, on the top of which little boys swung and smiled. There was a troop of trained lions, their manes gilded, that walked on tight-ropes, wrote obscenities in Greek, and danced to cymbals which one of them played. There were goose-fights, wonderful combats between dwarfs and women; a chariot race, in which bulls, painted white, held the reins, standing upright while drawn at full speed; a chase of ostriches, and feats of *haute école* on zebras from Madagascar.

The interlude at an end, the sand was raked, and preceded by the pomp of lictors, interminable files of gladiators entered, holding their knives to Nero, that he might see that they were sharp. It was then the eyes of the vestals lighted; artistic death was their chiefest joy, and in a moment, when the spectacle began and the first gladiator fell, above the din you could hear their cry "*hic habet!*" and watch their delicate thumbs reverse.

There was no cowardice in that arena. If by chance any hesitation were discernible, instantly there were hot irons, the sear of which revived courage at once. But that was rare. The gladiators fought for applause, for liberty, for death; fought manfully, skillfully, terribly, too, and received the point of the sword or the palm of the victor, their expression unchanged, the face unmoved. Among them, some provided with a net and prodigiously agile, pursued their adversaries hither and thither, trying to entangle them first and kill them later. Others protected by oblong shields and armed with short, sharp swords, fought

hand to hand. There were still others, mailed horsemen, who fought with the lance, and charioteers that dealt death from high Briton cars.

As a spectacle it was unique; one that the Romans, or more exactly their predecessors, the Etruscans, had devised to train their children for war and allay the fear of blood. It had been serviceable, indeed, and though the need of it had gone, still the institution endured, and in enduring constituted the chief delight of the vestals and of Rome. By means of it a bankrupt became consul and an emperor beloved. It had staid revolutions, it was the tax of the proletariat on the rich. Silver and bread were for the individual, but spectacles were for the crowd.

During the pauses of the combats the dead were removed by men masked as Mercury, god of hell; red irons, that others, masked as Charon, bore, being first applied as safeguard against swoon or fraud. And when, to the kisses of flutes, the last palm had been awarded, the last death acclaimed, a ballet was given, that of Paris and Venus, which Apuleius has described so well, and for afterpiece the romance of Pasiphaë and the bull. Then, as night descended, so did torches, too; the arena was strewn with vermillion; tables were set, and to the incitement of crotals, Lydians danced before the multitude, toasting the last act of that wonderful day.—Edgar Saltus' "*Imperial Purple.*"

### Overworked Employees.

There is no doubt that on the great majority of the railroads in the United States the employees are overworked. As a rule the trainmen have long hours. Many of them do not know what it is to have regular Sundays or "days off." They are afforded scarcely sufficient time for sleep, much less for recreation of any sort. While the trainmen have bitter cause for complaint, there is a large class of men in the service of the railroads who are, if possible, even worse off. These are the telegraph operators and the switch tower men.

A switch tower operative in the employ of one of the principal railroad companies is a case in point. The man was completely "fagged out" by twelve hours of continuous duty at the switch levers. The poor fellow said: "It is no wonder that so many accidents take place on the lines in different parts of the country. I speak from experience. There are times when I am so sleepy that it is with the greatest effort that I can keep my eyes open at all, but all the levers in the tower must be watched. The slightest inattention on my part might result in the wrecking of a train and a terrible loss of human life."

**A SUNDAY SUGGESTION.**

What though the politicians rage  
 And candidates conspire and plan,  
 Let seas and hills and streams engage  
 The efforts of the wiser man:  
 To him the brown thrush from the glade,  
 The murmuring brook cries: "Come and rest."  
 Along the grass, beneath the shade,  
 Upon our common mother's breast!"

What though there's scandal in the air  
 And worthless placemen twist and hedge,  
 The blackbird pipes, the frisky hare  
 Gambols adown the breezy sedge:  
 From yonder towering poplar tree  
 The wood-dove's notes melodious sound  
 And chipmunks whisk in humble glee  
 Their striped sides along the ground!

Come from the town's unwholesome streets  
 And walls of heated brick, away  
 To where the surf its music beats  
 In cadences of curling spray:  
 Come to the glorious mountain side  
 Where radiant summer reigns supreme,  
 And let "dull care," what e'er betide,  
 Be banished like a weary dream!

—*New York World.*

**LaGuillotine.**

One of the most widely disseminated of popular errors is that Dr. Guillotin invented the grim machine which still bears his name. The real inventor of this sinister contrivance was Dr. Louis, a well-known medical man and permanent secretary of the Parisian School of Medicine, or Academie de Medicine. The teachings of Baccaria, indorsed as they were by Voltaire and other humanitarian writers of the eighteenth century, had at last awakened in the minds of the people a feeling of revulsion against the prevalent barbarous method of putting criminals to death. Louis XVI remembered with horror the indescribable torments to which the wretched Damiens had been subjected for an attempt on the life of his predecessor, and early in his own reign manifested a desire to effect a complete reformation of the prison system throughout his dominions.

In 1783 he wrote a letter to his brother-in-law, Joesph II, on this subject, and on many occasions manifested a keen interest in everything connected with a more humane treatment of prisoners and condemned persons. The queen, too, had placed herself at the head of a society of ladies who devoted some of their leisure to the visitation of prisons, and the subject of their reformation had become fashionably popular. In 1785 Dr. Louis, a well-known professor of pathology, modeled his apparatus on the manaja, a rougher sort of guillotine, which had been used in Italy for centuries.

On March 7, 1792, this gentleman read a paper on his invention before a select assembly of members of Parliament, and exhibited a small model of it, made for him by M. Schmidt, the famous manufacturer of musical instruments, who was so liber-

ally patronized by Marie Antoinette, for whom he constructed several of his most elaborate spinets and harpsichords. Little did he imagine that he had exhibited a model for an instrument which, within two years, would destroy both his illustrious patroness and her husband.

On March 25 a resolution was passed by the national assembly recommending the immediate introduction of the machines in question in all prisons throughout the country. The invention was first called the "Louisson," after its real inventor. Dr. Guillotin, who continued his crusade against the rack, the wheel, the rope and the stake—all of which had only recently been abolished, and several of which, notably the wheel, were still in use in the southern provinces—constantly spoke with such enthusiasm of Dr. Louis' apparatus that the people ended by giving his name to it, and he was presently credited with having invented an instrument which he had only introduced to public attention.

On April 25, 1792, the guillotine was publicly used for the first time, and beheaded a bandit named Pelissier. This was in the Place de Greve, where some twenty years previously Damiens had been tormented for days in precisely the same way as Ravallac had been for the assassination of Henry IV.

During four months after the execution the machine which was eventually to achieve such sinister celebrity was disused. In August it was transferred to the Place du Carousel, and a few weeks later it was alternately stationed in the Place de Greve, the center of what is now called the Place de la Concorde, and in the Place du Trone.

It was in the Place de la Concorde that Louis XVI, Marie Antoinette, Mme. Elizabeth and some 8,000 other victims fell beneath the identical blade which, by a curious irony of fate, is now to be seen in the chamber of horrors at Mme. Tussaud's. As it is impossible now to ascertain the exact number of the victims of the massacre of St. Bartholomew, so it is impossible to give a correct estimate of the number of persons who were put to death by the guillotine in France between August 10, 1792, and the 9th "Thermidor," 1794, but it was certainly not under 40,000.

Lamartine and Thiers gave the number as under 20,000, but they do not seem to have been acquainted with the evidence which has been discovered during the last few years of the facts of the "Comite du Salut Public" in the small towns and villages where rudely constructed guillotines were erected and performed their awful work with appalling regularity. Under the empire and restoration the guillotine was permanently stationed in the Place de Greve, and executed annually between

thirty and forty persons. During the reign of Louis Phillippe the guillotine was transferred to the Barriere St. Jacques, and under the second empire to the Place de la Roquette, where it remains.

During the Commune the old guillotine was burnt by the people, and the present instrument is quite new. Sanson, who was the public executioner throughout the Reign of Terror, sold the original guillotine to Curtius for £1,000, and he in his turn disposed of it for a larger sum to his niece, Mme. Tussaud. Dr. Guillotin, who died in 1814, energetically, but vainly, protested against the use of his name in connection with this disagreeable subject.

Another evidence, if one were wanted, of the great difficulty there is of correcting a popular error. Needless to say that the legend that Dr. Guillotin was among the victims of his friend's ingenious and merciful instrument of destruction is wholly apocryphal. He died at a good old age, and in his bed, surrounded by his children, who, however, obtained permission to change their name.—*London Saturday Review*.

### The Pious-Looking Stranger.

Over in Missouri there is a certain plank road and a certain toll-gate. Beside the toll-gate there is a farm-house, on the cool and comfortable porch whereof the worthy farmer usually sits, waiting to collect toll, while his boy Bill ploughs the corn in the field away beyond. On a certain recent occasion, however, this worthy farmer happened to be over in the field helping his boy Bill when a pious-looking stranger drove up to the toll-gate. There was no one in the farm house, no one nearer than the farmer and his boy Bill, half a mile away in the field. The toll-gate was unlocked—open, in fact—but this pious stranger was temptation-proof. He hitched his horse to a tree and proudly floundered out to where the farmer and his boy Bill were at work.

"My good man," said he, "are you the keeper of this toll-gate?"

"Yep," said the worthy farmer.

"What is the toll, my good man?"

"Five cents."

"Well, I wish to drive through, my good man, and here is your five cents."

The worthy farmer scratched his head anxiously for a brief period. "Did you come out here just to give me that nickel?" he asked presently.

"For no other purpose, my good sir," and the pious-appearing man ambled soulfully away.

"Bill," said the farmer to his boy in an agitated undertone, "get on the old gray mare and watch that stranger till he gets to town."—*Quincy, Ill., Herald*.

### Large Landowners.

There is only one landed proprietor in England possessed of more than 100,000 acres in one county, there being three in Ireland and no less than fourteen in Scotland. In England the Duke of Northumberland is proprietor of 181,616 acres in Northumberland. In Ireland Mr. Richard Burridge is proprietor of 160,152 acres in Galway, the Marquis Conyngham 129,846 acres in Donegal, and the Marquis of Sligo 122,992 in Mayo. In Scotland the Duke of Argyll is proprietor of 168,315 acres in Argyll, the Earl of Breadalbane 234,166 acres in Perth and 204,192 acres in Argyll; Mr. Evan Bailie, of Dochfour, 141,148 acres in Inverness; the Duke of Buccleuch, 253,179 acres in Dumfries and 104,461 in Roxburgh; Mr. Donald Cameron, of Lochiel, 109,574 acres in Inverness; the Earl of Dalhousie 136,602 acres in Forfar, the Duke of Fife 139,829 acres in Aberdeen, the Duke of Hamilton 102,210 acres in Bute, Sir George Macpherson-Grant 103,372 acres in Inverness, Sir James Matheson 406,070 acres in Ross, the Duke of Richmond 159,952 acres in Banff, Sir Charles Ross 110,445 acres in Ross, the Earl of Seafield 160,224 acres in Inverness, and last, but not least, the Duke of Sutherland with no less than 1,176,454 acres in Sutherland, so that his grace is possessed of very nearly the whole county, the total area of which is 1,297,846 acres.

### Writ of Injunction.

Senator Allen, of Nebraska, has introduced in Congress a bill for the "prevention of the abuse of the writ of injunction." The bill provides that it shall be unlawful for any Court of the United States, or Judge thereof, to issue a writ of injunction, mandate, or restraining order against any labor organization, its officers or members, in any manner affecting their full freedom to peacefully and quietly quit the service of any person or corporation at any time they may see proper to do so. Mr. McGinn, of Illinois, introduced in the House a resolution directing the Judiciary Committee to investigate the charges made against Judge Jenkins, who issued the injunction against Northern Pacific employees in Wisconsin, and to report whether they warrant the presentment of articles of impeachment; also to report what action is necessary to prevent a recurrence of the conditions now laid by the injunction upon the Northern Pacific and other railroad employees and labor organizations. The resolution has a long preamble, reciting the right of employees to organize and strike, and Judge Jenkins' order restraining the employees of the Northern Pacific from exercising this right.

## GRAND LODGE.

**Assessment Notice for May.**

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., May 1, 1894.  
ASSESSMENT No. 45, \$2.00.

**To Receivers of Subordinate Lodges:**

SIRS AND BROTHERS:—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz:

CLAIM No. 1233. Enoch B. Henney, of Davy Crockett Lodge, No. 145, died of Ulceration of Bowels, November 16, 1893.

CLAIM No. 1234. Frank Simmons, of Just in Time Lodge, No. 149, died of Small Pox, December 11, 1893.

CLAIM No. 1235. Cornelius Collins, of Golden Eagle Lodge, No. 78, was killed by Gun Shot Wound, December 23, 1893.

CLAIM No. 1236. John Ragan, of Mt. Helena Lodge, No. 123, was killed in a Railway Accident, December 31, 1893.

CLAIM No. 1237. James G. Cary, of Red Mountain Lodge, No. 339, was declared totally disabled by Loss of Arm, January 12, 1894.

CLAIM No. 1238. Michael Corcoran, of Resurrection Lodge, No. 189, was declared totally disabled by Compound Fracture of Ankle, January 13, 1894.

CLAIM No. 1239. Frank Smith, of Golden Rod Lodge, No. 504, was killed in a Railway Accident, January 14, 1894.

CLAIM No. 1240. Arthur C. Briggs, of Golden Gate Lodge, No. 91, was Drowned, January 14, 1894.

CLAIM No. 1241. John Hewitt, of Golden Gate Lodge, No. 91, died of Phthisis, January 14, 1894.

CLAIM No. 1242. John F. Birdsell, of Big Four Lodge, No. 337, was declared totally disabled by Loss of Leg, January 16, 1894.

CLAIM No. 1243. E. S. Stickle, of Taylor Lodge, No. 175, was declared totally disabled by Disease of Brain, January 19, 1894.

**Special Assessment Notice.**

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., April 1, 1894.

SPECIAL ASSESSMENT No. 3, \$0.75.

To all Subordinate Lodges:

DEAR SIRS AND BROTHERS:—You are hereby notified that Special Assessment No. 3, amounting to seventy-five cents (\$0.75), has this day been levied by the grand lodge for the Protective Fund, to be used in paying the striking firemen on the Lehigh Valley Railroad who engaged in a strike, beginning November 18th, 1893, and ending December 6th, 1893, under the laws of our order. A majority of the lodges belonging to the Brotherhood of Locomotive Firemen have voted to levy this special assessment, and the will of the majority becoming the law, this levy is made. (See Section 41, Page 16, of Constitution.) This assessment is payable by all members whose names appear on the rolls of membership on April 1st, 1894, and must be paid to the Collector on or before May 1st, 1894. Any member failing to pay the foregoing assessment within the time specified will stand expelled as provided by the laws of the order.

Collectors are required to deliver the foregoing assessment to the Receivers of their respective lodges on or before May 2d, and Receivers are required to forward the same so as to reach the grand lodge on or before May 10th, 1894.

Collectors and Receivers are required to make collection and returns of the above assessment in all things as provided by law for the collection and returns of assessments for the beneficiary department.

Collectors will receipt for this assessment on the usual form, as no special slips have been issued.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. and T.

Do You Want a Picture of the

## FAMOUS "999" LOCOMOTIVE?

We've had hundreds of letters asking for a picture—now we have it. Something better than a photograph. A **transparent**, copper-plate engraving of the famous flyer; you can see everything **outside** and **inside**. Every part is numbered and named. Fit for a gold frame in a palace. Printed on satin gloss paper, 14x28, and mailed in a tube (without folding) for 50 cents (stamps are good, but we would rather have postal notes or money orders). This is an educational device, up to date, unique, beautiful and correct. Once seen, no other picture of this beautiful locomotive will satisfy you at all. Send cash with order. **LOCOMOTIVE ENGINEERING, 5 Beekman St., New York City.**

If you are a subscriber, for 1894, to our paper, **Locomotive Engineering**, you get the above picture and our other little school masters, the **Traveling Engineer's Examination Chart** and the **Working Model of the Triple Valve**,

► **FREE.** ◄

The paper has over 40 large pages and is the best illustrated and "**most interesting railroad paper published.**" Practical, instructive, interesting! No engineer, fireman or shop man can afford to be without it. Sent to any address in the world for \$2.00. Angus Sinclair and John A. Hill, Editors. Specimen Copy, free. Address

# IMPORTANT.

In view of the present uncertainty of business, we have decided to offer the two works of Professor N. Hawkins upon easy and liberal terms of payment to the patrons of the FIREMEN'S MAGAZINE and others, who will furnish a reference as to reliability, i. e., part of the cost with the order when the books will be sent, and balance monthly.

It is a proverb that "he stands strongest who stands on his head"—this has been well illustrated in the case of the owner of these two books. In the numerous changes which have taken place in the past half year, and which are still going on, the practical knowledge which has been acquired from the Hawkins works has enabled many of their possessors to hold over in good positions where others have been forced to resign.

The "Hand-book of Calculations" (now selling in its seventh thousand), and the "Maxims and Instructions for the Boiler Room" (now selling in its third thousand), are educational works of the rarest value, and have already, in scores and hundreds of instances, proved the stepping-stone for permanent advancement (Firemen to be Engineers, Engineers to be Superintendents, etc.).

The "Calculations" teaches first, the principles on which steam-engineering is founded, i. e., mechanical philosophy, and beginning with the figure one, proceeds with rules, examples, and plain directions to the most essential problems relating to steam-engineering.

The "Maxims and Instructions" teaches how to "fire" with all kinds of fuels and the different varieties of boilers; gives details of construction and dimensions of boilers. It deals with the details and management of pipes and piping, steam-pumps, injectors, tanks, steam-heating, plumbing, etc. The book has hundreds of definitions and illustrations of appliances used in and about the boiler room.

These books are each provided with a ready reference index, which renders their hundreds of practical suggestions instantly available; hence they are works of both instruction and reference.

These two books are each strongly and handsomely bound in green cloth, with gold titles; they weigh over five pounds for the pair and are almost a library in themselves. The price is \$5.00 for the two, and \$2.50 for a single volume, post or express prepaid to any part of the world.

Parties wishing them on "part payments" will be informed of the terms upon application. Club rates also given on application. Correspondence solicited. We furnish a descriptive catalogue free.

**Theo. Audel & Co.,**  
PUBLISHERS.

Office 3. 91 Liberty St., N. Y.

P. S.—Very many Master Mechanics of railroads have bought the pair of these "noble books" and found them exactly adapted to their department of railroad service.

# YES! Are You a Union Man? WHY?

Because I believe that nothing else will enable me to better my condition. I want, and I believe I am entitled to, shorter hours of work, and I want good pay for the same, so that I can enjoy some of the good things of this life. I have heard of and read about many things which are put forth as likely to benefit workingmen; for instance, co-operation, state socialism, land reform, but every one of these, owing to the fixed habits of mankind, would take a generation or two to change laws.

These sentiments are good in theory, what do you propose to do individually to practically carry them out? I am glad you asked me the question, as it gives me a chance to say to you that I individually intend to patronize only Union Firms and buy only goods made by Union Labor, as this keeps Union people employed, and this is why whenever I want a pair of overalls to work in, or a pair of pants for holiday wear, that I always buy those made by **SWEET, ORR & CO.**, and I want my fellow workmen to do the same. Their overalls never rip, and pants made by **SWEET, ORR & CO.** are the best fitting in the world and always guaranteed to be correct in every particular. They can be had, or ought to be had, in every city in the Union.

## Marks' Patent Artificial Limbs

WITH RUBBER HANDS AND FEET

Are Natural in Action, Noiseless in Motion, and the Most Durable in Construction.

It is not unusual to see an engineer with hand on the throttle, or a conductor, baggage-master, brakeman, fireman, carpenter, farmer, mason, miner, and in fact men of every vocation, wearing one or two artificial legs, with rubber feet of Marks' Patents, performing as much labor as men in possession of all their natural members, earning the same wages; in fact, experiencing little or no inconvenience.

## RAILWAY OFFICIALS AND EMPLOYEES ACCIDENT ASSOCIATION

INDIANAPOLIS, IND.  
W. M. K. BELLIS, SEC.

## THE WHEEL

Of progress too often becomes the Wheel of Destruction, and at such times the possession of a staunch true friend, to whom the

### RAILROADER'S FAMILY

Can appeal in their sorrow, is the greatest boon on earth. Such a friend is the RAILWAY OFFICIALS AND EMPLOYEES' ACCIDENT ASSOCIATION, of Indianapolis, whose unparalleled growth during the past year, showing an increase of

**\$21,000,000,00**

Over the previous season, unanswerably demonstrates its overwhelming popularity with the Railroaders of America.

### THINK OF IT!

If you should get caught in that fatal accident which visits so many noble men, and leave nothing to your dear ones, what would become of them? A Certificate of Membership in the RAILWAY OFFICIALS AND EMPLOYEES' ACCIDENT ASSOCIATION is as safe and certain as a landed estate, and the relief it secures to the bereaved family is flashed over the wires the very moment the news of a stroke of misfortune reaches the Home Office. No Sensible Railroader longer doubts it his duty to carry first-class Accident Insurance. Do not postpone until it is too late, but take a membership with us

# HEROES OF PEACE!

**They are Greater Than The Heroes of War!  
AND DESERVE PRAISE.**

**How the Devoted Lives of Railroad  
Engineers are Beset on Every  
Side and How to Escape Some  
of the Worst Dangers.**

It is a mistake to suppose that heroes only die upon the battlefield.

The daily battle of life sees more heroes, is full of more pathos, has things more terrible than the greatest struggle between the hosts of war. In the patient suffering, cheerful resignation, fidelity to duty, we behold heroes as lofty, as lovely and as worthy as any ever exhibited by the soldier.

We are here reminded that among the fighters in the battles of peace, the engineer stands forth prominently as the embodiment of the heroic. We read, only the other day, of the engineer of a wrecked train mutilated and in great agony, and in intense darkness, crawling along the slippery track, lantern in hand, to warn an approaching train against danger. Such instances of devotion are innumerable, but the thoughtful recognize the spirit of heroism which is made manifest by the stories and understand how terrible is the mental and physical strain with which the railroad man has to deal.

Is it at all wonderful that with the constant jar, the irregular hours, irregular meals, the care, the responsibility, to say nothing of the labor itself, many men break down? Is it at all wonderful that they look for help which will relieve their nervous system of its cares, which will place life and health upon a sure foundation?

Hundreds of engineers and railroad men have found a remedy which is precisely suited to their needs, which will counteract the evil effects that the constant jarring and jolting has had upon their kidneys, and which will tend to keep them in health, in strength, and prolong their lives. A few of the names of those who have discovered this secret are given herewith:

Mr. A. G. Dingwall, of Salt Lake City, says: "I do not hesitate to recommend to locomotive engineers or others who may suffer from the effects of hard riding on any kind of rolling stock, Warner's Safe Cure. Have had trouble of this kind myself, and know that Warner's Safe Cure is most efficacious in its action on the kidneys. I know of other railroad men who have great faith in it for any of the inconveniences resulting from riding long distances on rough riding engines, and have always resorted to its use for cold in shoulders, back or side. I carry a bottle of it on my engine with me all the time, and my faith in its power to give relief has never yet been shaken. My advice to engineers who may occasionally be afflicted with any of the ills that arise from riding in hard riding engines is, try Warner's Safe Cure, and persevere with it, and the result will be most gratifying to you."

George F. Anderson, 624 Olive street, St. Louis, Mo., says: "I am a conductor on a Missouri street railway. Before coming to this work I was a brakeman on the Missouri Pacific R. R., and had to give up work because I had kidney trouble. I was so bad at times that I could not walk the length of the car without having to sit down and ease the pain in my back. I was obliged to give up my position and look for something that would not be so tiring. A couple of weeks after I accepted my present situation. I found that the jolting of the street cars was about as bad as the others, and my kidney trouble returned. An old conductor on the line told me to use Warner's Safe Cure. I stuck to the medicine faithfully and managed to hold my job. I have not had a day's sickness this winter."

A. Coleman, Buffalo, N. Y. (N. Y. C. & H. R. R. Engineer), declares: "Some six years ago I was afflicted with neuralgia and constant pains in my side and back. I commenced using Warner's Safe Cure. I had finished two bottles with marked improvement in my case, but kept at it until I had used over twenty bottles. I was so bad at one time that I could not bend my knee to pick up anything. I am sure that without the use of your Warner's Safe Cure I would be in my grave to-day. I can daily attend to my business on the road now, free from pain and a well man."

James M. Dunden, Fitchburg, Mass., asserts: "I have been an engineer on the Fitchburg Ry. for two years, was fireman on the same road for three years. About five years ago I was troubled with my kidneys and bladder so bad that it was almost impossible for me to urinate. I was so bad that I had to stop work a number of times. I saw Warner's Safe Cure advertised, got a bottle and commenced taking it. I continued its use and am now in perfect health."

George E. Thomas, C. E., 478 Calumet avenue, Chicago, Ill., states: "My business as civil engineer, in connection with railroad work, necessitates almost constant traveling. The result was disease of the kidneys, which gave me great trouble. The use of Warner's Safe Cure entirely cured me."

Mr. Horace A. Hamilton, of Worcester, Mass., says: "My life as a railroad engineer produced disordered liver and kidneys, constant pain in the back, etc. At times I could not void urine for forty-eight hours, and then high colored with brick dust and albuminous deposit. When all other medicines failed a few bottles of Warner's Safe Cure made me well so that now I am all right. My wife was afflicted with troubles peculiar to her sex, and Warner's Safe Cure acted like magic in restoring her to health and strength."

Such statements speak for themselves. They show that for railroad and traveling men there is nothing which so preserves the health and prolongs the life as Warner's Safe Cure. They show conclusively that what this great remedy has done for others it is able to do again, perhaps for you. Bear in mind, "there is danger in delay!"

1 Broadway, New York. 308 Walnut St., Philadelphia  
70 Kilby St., Boston. 36 Main St., Norfolk, Va.  
1 Fenchurch Ave., London, England.

The Pocahontas Coal is acknowledged by all railroads that have used it to be the best American coal for Locomotive use. It generates steam with great rapidity, and at the same time holds the fire an unusually long time. The merits of the coal are shown by the unprecedented growth of the mines, which were not opened until 1883. Since that time the out-puts have increased over 1,200 per cent. beyond all precedent, amounting during 1892 to 3,000,000 tons. During the present year it will be at least 2,000,000 tons. We are therefore prepared to fill all orders with prompt dispatch.

88 Market St. Chicago.

### WHAT THEY SAY ABOUT OUR

ELDON, Ia., Dec. 18, 1893.

DEAR SIR:—Please send me one of your seats for locomotive use. I find that they are the best seat for engine use that I have seen yet. I want it 24 inches long and 20 inches wide. Weight, 170 pounds. Send it C. O. D.

Yours respectfully,  
(Signed) W. T. BROWN,  
Engineer C. R. I. & P. R. R.

We refer by permission to the following users: D. J. Crowley, Engineer S. F. & W. Ry., 16 Jones st., Savannah, Ga.; Jno. Horton, Engineer Grand Junction, Colo.; Wm. Malloch, Engineer G. T. Ry., Belleville, Ont.

## ALL STEEL CAB SEAT.

**ROUGH RIDING MADE EASY.** Just put this seat in the box and lay your cushion on it. Made only of finest tempered steel spiral springs, heavy band steel bottom frame, and tempered woven wire fabric. Any size or shape desired. Usual size, 18x24. Price for seat not over 24 inches long, \$2.00. Terms, C. O. D. or cash with order. Please give your weight.

MANUFACTURED ONLY BY

**SMITH & HAGGARD CO., Dept. B.**

Cor. Sacramento and Carroll Aves.,

CHICAGO, ILL.

CHAS. MILLER, President

## Galena Oil Works, Limited. FRANKLIN, PA.

### SAFETY, SPEED, ECONOMY

Are the results of the use of Galena Oils. Scientific and practical tests of the past twenty years have demonstrated the fact that Galena Oils are superior to any other oils in the market.

Galena Oils in winter stand a cold test of from ten to fifteen degrees below zero, and will not freeze in the coldest weather.

The superiority of Galena Oil is demonstrated by their exclusive use upon a large majority of the railways of this country. They are in use upon three continuous lines of railways from Boston and New York to the Pacific coast and on one to the City of Mexico, thus demonstrating their adaptability to all climates and all temperatures.

We also supply our patrons with Sibley's Perfection Valve Oil, which is in exclusive use upon a large majority of the leading railroads of the country.

**NOTE**—There are many injectors which will work well when the conditions are favorable. This injector is designed to work well under all conditions and is, therefore the most reliable.

**IT WILL RE-START ITSELF.**

**IT WILL ADJUST ITSELF.**

**IT WILL LIFT HOT OR COLD WATER.**

Its range of capacity is over 60 per cent. and it can be regulated, therefore, to work continuously for light or heavy trains. It is operated by a simple lever motion which readily starts and stops its action.

## BROOKS LOCOMOTIVE WORKS,

Dunkirk, N. Y.

Builders of Locomotive Engines for any required service from our own designs or those of purchasers. Perfect interchangeability and all work fully guaranteed.

## FELLOW ENGINEERS AND RAILROAD MEN :

DEAR SIR:—Let me introduce you to "THE PRESIDENT" watch movement, just finished by The United States Watch Co., Waltham, Mass. It is the embodiment of every improvement and finest finish known to the art of watch-making. It is made especially for the Railroad trade and the exclusive control is in the hands of a Railroad man. For men in Train service, it has no equal, and the price is within the reach of all. Read carefully the Certificate below and buy no other until you have seen it.

Very respectfully yours, etc.,

"THE PRESIDENT."

*John J. McGrane*

OFFICE OF  
THE UNITED STATES WATCH CO. }  
WALTHAM, MASS.

This is to Certify, that Watch Movement No. called "The President," is First Quality Nickel, 18 Size, Full Plate, Stem Winding and Lever Setting. It has a **Double Roller Escapement, 17 Jewels** in Gold Settings, a Safety Pinion, Hardened and Tempered Breguet Hair-spring, Compensation Balance, Adjusted to **Heat, Cold, Isochronism, and All Positions**, Matheson's Patent Regulator, Double Sunk Dial, and is highly finished in all its parts.

The movement is made in both Open Face and Hunting, and is the only 18 size Double Roller, Lever Setting Movement on the market.

Having all the advantages of this form of escapement, it recommends itself at once especially for Railroad Service and all conditions where the watch is subjected to violent external motions.

The Company guarantees that this movement will vary less than Six seconds in a calendar month, and fully warrants and defends each and every representation above made. Ask your Jeweler for it.

THE UNITED STATES WATCH COMPANY,

BY

## FRANCHISES AND MONOPOLIES.

BY S. D. GUION.

No great fortunes can be made except by means of the taxing power, by means of franchises and monopolies, but all franchises and monopolies are created by the taxing power. The operation of franchises and monopolies not only give their owners the opportunity to tax all others by charging more for their services or commodities than they are worth, and more than they would cost in a free market, but to deprive all others of their equal rights. Great fortunes can not be accumulated except as power is given to draw from the earnings of others without compensation. Only by taxation can the earnings of others be taken from them without compensation. By charging more for their services and commodities than they are worth can franchises and monopolies draw from the earnings of others. Their charges are as high as the traffic will stand or the utmost limit which others can be forced to pay, thus assuring to themselves the maximum of accumulation.

Take the sugar monopoly. To tax raw sugar only, would injure the manufactures as well as the consumer of the refined sugar. It would increase the cost of production to the manufacturer of the refined just the amount of tax on the raw sugar, which he, of course, would shift to the consumer. But with increased cost consumption is lessened, and with lessened consumption the manufacturer must reduce his output, it, therefore, will be an injury to him. But there is always imposed what is called a compensatory tax on refined sugar of foreign make. This tax the manufacturer adds to the price of his sugar, or only so much of it as will make it impossible for the foreign made to be brought in and compete with him. In such case he will be able to add but part of the tax, but that part which he is able to add constitutes a tax which he has the power to impose on all others, taking from their earnings without compensation what-

ever the sum may be, and adding the same to his accumulations. He has not earned it, but the law having given him a monopoly he takes the opportunity to rob every person who buys his commodity.

Take a franchise, gas for instance. A company applies for the privilege of laying pipes through the streets of a city or town for the purpose of conveying gas to customers. After much higgling as to price and what its rights shall be, the franchise is finally granted upon the payment of a merely nominal sum, a sum insignificant and out of all proportion to the benefits conferred. The company has acquired public rights, one of which is the right to tax every person who patronizes it. It goes into operation. At first no figures appear on the profit side of the ledger, but as its pipes are extended and its customers multiply, profits appear and steadily increase. At first we will say they are 5 per cent., then 10 per cent., then 20 per cent., and so on, up to 100 per cent. or more. The company, because of its franchise, and having the power to tax, can compel the people to pay it enormous profits. It is not to be supposed that the people would willingly contribute to its enrichment with such a lavish hand. Every cent it collects beyond a fair and reasonable profit is a tax which the law gives it the right and power to impose, and every cent it takes beyond such fair and reasonable profit it takes from the earnings of the people without compensation, and adds to its accumulations. This sum, however small or great it may be, is a robbery of every person who uses its gas. Gas works are natural monopolies and should be owned and controlled by the government. It is one of the functions of government.

Take railroad monopoly,—that necessarily held by a road doing a great freight and passenger business. It must have a wide stretch of territory in which to operate without competition to insure its existence, that is, if the usual salaries to officers, at-

torneys and dividends on stock, including the water, must be paid, \$50,000 a year to its president, and salaries to other officers proportionate to their standing. The enormous salaries and exorbitant percentage paid to stockholders are all gotten in the ordinary, legitimate manner. The road is empowered by law to charge all the traffic will stand. It is a monopoly. It has no competitors. All who desire the services of the road must go to it and pay its charges. These charges include the enormous salaries and exorbitant dividends to which all in the territory and thousands besides must continually contribute. The sum that the road can appropriate from the earnings of the people beyond a fair and reasonable profit without compensation is unearned by the road, and is robbery, and no less a robbery because the privilege and power was given it by law. This robbery will go on until the people, through their government, take possession of the road beds and manage them in the interest of the whole people. This it may do by right of eminent domain.

Take land monopoly. When compared to land monopoly all others sink into insignificance. It is only by reason of land monopoly that other monopolies can be maintained; without that others would be impossible. Abolish all taxes, and take the rental value of land for public purposes would make land monopoly impossible. The abolition of all taxes, would, of course, include tariff taxes. The abolition of the tariff tax on sugar would kill the sugar monopoly. Let foreign refined sugar come in free and American refiners could not maintain a monopoly, but as the labor cost to them to refine is less than to any foreigner, and as they could buy their raw sugar at the same price as the foreigner they could hold the market against him. As they would be obliged to sell cheaper—as they could, of course, with the tax off the raw sugar—than they do or even can now, their sales would be so much larger as to swell their profits to greater dimensions. But our virtuous and honorable senators would have forever lost the opportunity of making a few hundred thousand dollars by dealing in sugar trust certificates, and also of finding their pocket books greatly distended in a no less honorable (?) way, to-wit: by conferring with the head of the sugar trust.

The abolition of all taxes and using ground rents for public purposes would kill the gas monopoly. The value of a franchise, the value subject to taxation, is land value. The only value that is rightfully subject to taxation is that given by the public, by the presence of the community, by public improvements, by civilization. Nothing that has value not thus created is a rightful sub-

ject of taxation. The value of a franchise being thus created is, therefore, a rightful subject of taxation. When such values are taken for public use, and only such franchises will bear their just and equitable share of public burdens, and will cease to be monopolies.

If to-day all franchises were taxed on the value thus created, the tax rate would be so greatly reduced that every member of the community would easily and quickly realize the benefit. Thus by taxing land values, by taxing those values, and those values only, those values which are created, and can only be created by the public, by the whole community, all franchises would pay a just and equitable tax, and all monopolies would be taxed out of existence. The application of the single tax, would annihilate land monopoly. Land monopoly being the mother of others, others could not come into existence. The public is to-day the rightful owner of all those businesses or industries which are in their nature monopolistic, and would then be controlled and managed by the state or municipality. Then, instead of ground rents, which are created by the public, going into private pockets, they would go into the public treasury. Instead of the enormous salaries, the exorbitant dividends and excessive profits, which likewise go into private pockets, would also go into the public treasury, and all be used to defray public expenses, as justice and equity demands. The power that creates may likewise destroy. They were created by the taxing power, and it may destroy them.

Land monopoly exists in the right—legal right, but contrary to natural right—of private ownership of land, and gives the owner the right to hold it out of use, to refuse to let others use it and to charge others for its use. The value that he charges others for it he did not give it and is not his, it was given by the public and belongs to it. Land is a product of nature, man had no hand in its creation, human labor took no part in its formation; did not add one grain to its bulk nor one ounce to its weight. Therefore, man can have no right of ownership in it. It is only by human labor that such right is or can be acquired. Man is likewise a product of nature, and must have equal rights in, and to nature. One of the acknowledged natural rights of man is the right to maintain himself; it is only by the use of land that this can be done, therefore, his equal right in, and to nature, must be his equal right to the use of land. As the right of ownership can be acquired only by human labor, it therefore follows that no man can have the right of ownership of land. Man can rightfully own only that which man has created or produced. Man as a member of

community creates land values. Man can create land values only by being a member of community. Each man is a joint owner in the values which each member of the community has jointly created. It is, therefore, the community in which is vested the ownership of land values. It does not nor does any of its members create land, therefore, it nor they nor any one of them can rightfully own land. Communities form themselves into governments. Governments must be supported. Governments as well as men should use their own resources to defray their expenses. When men take from the resources of others the means to defray their expenses we say they have committed a robbery. When government takes from the resources of the people to defray its expenses it also commits a robbery. It does it on a grand scale and calls it legal, yet it is more infamous and detestable. Governments always have adequate means in the land values created by the community to defray all its expenses. Let governments use all this value to defray its own expenses. Then no great fortunes could be made, as then neither individuals nor corporations could get possession of any of this value. Governments having ceased to impose taxes, there could be no more legal robbery. Each man would come into possession of his natural rights, franchises could trouble us no more forever, and monopolies, having been deprived of their source of life, would become but a memory of the past.

### WANTED, A NEW ETHIC.

BY WILFRED P. BORLAND.

The mere vague impulse in man to do his duty is barren without the knowledge which enables him to perceive what his duties are and how to perform them; and it is the province of ethics to supply such knowledge that man's impulse to do his duty may be fruitful of good both to himself and his fellow man. Up to the present time we have never had an ethic that embraced the whole of society, that was universal in its application. We have had one ethic for one portion of society and another for the other portion, and this is no more than the natural consequence flowing from the differentiation of society into two classes, the rulers and the ruled. It is not to be expected that this same ethic would answer for both classes when their ends and aims in life are so totally different. In ancient times the differentiation between the rulers and the ruled took place arbitrarily on the basis of master and slave, and there was no hypocritical pretense of an universal ethic. In our own times the differentiation takes place on the basis of the rich and the poor, and there is a pretense, which is the rank-

est hypocrisy, that society is governed by an universal ethic, or code of ethics. In ancient Greece there was no pretense whatever that what was morally right for the master was morally right for the slave. The Greeks were not hypocrites in their social relations, they were frank to the point of bluntness in their teaching of two ethics—the one for the master the other for the slave.

Aristotle says: "Nature creates some men for liberty and others for slavery. It is useful and just that the slave should obey. There are in the human race individuals as inferior to others as the body is to the soul, or as the beast is to the man. These are the beings suitable for the labors of the body alone, and incapable of doing anything more perfect. These individuals are destined by nature to slavery, because there is nothing better for them than to obey. The science of the master reduces itself to knowing how to make use of his slave. He is the master, not because he is the owner of the man, but because he makes use of his property. The citizens ought not to lead either the lives of mechanics or hucksters, for that kind of life has something base in it, and is contrary to virtue. To them also ought all property belong, since it is needful that the husbandmen be either slaves or barbarians or perioeki (serfs). It is not, therefore, proper for any man of honor, or any citizen, or any one who engages in public affairs, to learn these servile employments without they have occasion for them for their own use, for otherwise the distinction between master and slave would be lost."

Plato's code of ethics for the government of his ideal republic is the same as that of Aristotle. He (Plato) says: "Nature made neither shoemakers nor blacksmiths; such occupations degrade the people who engage in them, base mercenaries, nameless wretches, who are excluded by their condition from political rights. As to tradesmen, accustomed to lie and deceive, they will be suffered in the city only as a necessary evil. The citizen who shall degrade himself by shopkeeping will be prosecuted for this offense."

With these ideas permeating Grecian society, it was the most natural thing in the world that two ethics should make themselves plainly apparent, the one for the guidance of the rulers, or the members of society, the other for the guidance of the ruled, or those who were practically outside of society. It would have been regarded as an infamous proceeding, entirely inadmissible from a moral point of view, to compel a citizen of the state, however poverty stricken he might be, to associate on terms of equality with the beasts of burden and be driven along with them to the river

to drink, yet this was the common practice with regard to the treatment of the slaves, and it was regarded as quite the proper thing to do; and the citizen who should beat a slave would not be deemed guilty of any offense, while the slave who should attempt to strike a citizen would be held as guilty of an offense of such enormity that it could only be adequately punished by death. The same ideas and the same ethics prevailed in Roman society, and it was not until after Christianity had become organic that the notion was accepted of an universal ethic for the whole of the human race, for the ruler as well as the ruled, the master as well as the slave. But the universality of the Christian ethics had application only in one direction, to the spiritual rather than the material relations of men in society, to rules of faith rather than to rules of action.

The fathers of the church, indeed, taught that the slave was as worthy in the eyes of God as the master, and they laid down certain rules of conduct, which if followed without distinction of rank, would finally bring the master and slave upon exactly equal terms before the throne of Grace. But these rules of conduct related more to the relations of men to the church than to their relations with each other in society. They were calculated to establish rules of faith rather than rules of action, and did not interfere with the material relations of men except slightly, by reflection. The church accepted the division of society as she found it, as the natural order, and attempted to establish an ethic that should result in equal rewards in the life to come without interfering with the order of things as they had become established in this life. Indeed, submission to this order was taught as a Christian duty. This, of course, could only result in the continuance of two ethics, the one for the rulers, the other for the ruled, while the appearance of universality was maintained with respect to certain rules of conduct relating to the life beyond the grave, of which men knew nothing. The church did not attempt to interfere with the division of society into rulers and ruled; she even acquiesced in the idea that this division should be maintained on the basis of slavery, and, of course, with regard to the material relations of men in society there was no pretense of an universal ethic, there was no attempt to disguise the fact that the action which would receive severe condemnation when committed by one member of society, might be committed by another without the slightest fear of evil consequences to follow. But, during the evolution of society, the idea of an universal ethic has progressed until, nominally, all Christian communities are governed by a code of ethics that are applicable to all members alike, both in their material and

spiritual relations with each other.

The command to "love thy neighbor as thyself," as illustrated by the parable of the good Samaritan, has broadened out so as to embrace the whole of the human race. The idea of slavery, narrowed down at first to a question of race differences and applied solely to the relations existing between the white man and the black, has finally disappeared from the Christian code of ethics; and now all men, without distinction of race or color, are regarded as being equally entitled to freedom, equally children of God's family, all neighbors, and all subject to the same code of ethics without any distinctions of class or caste. In arriving at this result, the church has rarely, indeed, been a leader; she has been content to follow the current of public opinion when she could no longer successfully oppose it, and, instead of pointing out the way for others to follow, she has blindly groped along in the rear, giving her sanction to innovations only when compelled to do so by the public clamor, and clinging with wonderful tenacity to the relics of worn out traditions and puerile superstitions which humanity had outgrown. Professing to be the authoritative interpreter of the word of God, she has always exercised her function for the purpose of conserving the material relations of men in society as she has found them, always for the preservation of the status of ruler and ruled on whatever basis men had seen fit to establish it. When she could no longer conserve existing institutions by preaching slavery as a natural condition for a part of the human race, and in conformity with Christian ethics she preached the doctrine that poverty was a natural and divine institution for a part of the race, that men were born naturally rich and naturally poor, that the poor were naturally dependent on the rich for favors which they should receive from God, alone, and that this anomalous constitution of society was strictly conformable with universal Christian ethics. She has always been conservative, never progressive. The facts are, of course, what we might naturally expect them to be were we dealing with an institution that was the creation of the ruling classes, a strictly human institution, calculated for the purpose of keeping the masses in subjection; but this is not what the church professes to be. She professes to be a super-human institution, existing as a product of the divine afflatus, to expound God's word and to teach men a proper rule of life; to point out the way, to lead the procession in the march of human progress, to establish divine justice, divine ethics upon earth, not for a class or a portion of mankind, but, impartially, for all, for the entire human family. Out of the attempt to reconcile the profession with the facts has sprung a condition of the rank-

est hypocrisy; the church has warped divine ethics so as to make them conform to human institutions, instead of pointing out the way in which human institutions should be made to conform to divine ethics. Her pretensions of absolutism have been thrown in the scale for the preservation of iniquity instead of for the abolition of iniquity. In all this, it must be remembered that the church is spoken of as an organism. Some of the very best friends of humanity, of liberty, and of the emancipation of human reason from the thralldom of superstition, have been found within the fold of the church; but they have labored in defiance of her dogmas, as they have, by no means infrequently, suffered fearful persecution at her hands for their labors in the cause of human freedom.

Now, in spite of our universal Christian ethics, we continually are regaled with accounts of the doings of our "best citizens," or "our best people," which force us to the conclusion that society is still governed by two ethics. One would naturally suppose that the word "best," when used in this connection, signified those persons who had the most respect for the laws, the highest morality, as measured by the standard of the established ethic, and, in all other respects, those who furnished by the example of their lives the best standard for others to pattern after, from the standpoint of the highest social good; but such is not the case, for if it were possible for all to follow the example set by our "best people" society would soon become disrupted from top to bottom, social order would give place to chaos, and anarchy—in the common acceptance of the term—would reign instead of law.

The word "best," when used in this connection, is meant to signify persons who are governed by a somewhat different ethic than the common herd, to whom is accorded a certain license of action in their relations with their fellow men, and with society, not accorded to others, and who are not amenable to the laws in the same degree as are those who fail to measure up to the "best people" standard. We all know, for instance, that when one of these "best people" becomes beastly intoxicated, and creates disturbance on the street, the guardians of society deal very gently with him. He is not forcibly arrested and cast into a dungeon, to be afterwards hauled up before a magistrate and compelled to take his place in an indiscriminate crowd of criminals and prostitutes, to receive the sentence of the law and pay the penalty that society imposes for his misdemeanor. Oh no, that is not the way to handle one of the "best people!" He is restrained as gently as possible by the guardian of the peace; carefully taken up and placed in a

hack, accompanied to his home and assisted to his bed, where he is left to sleep off his debauch, and the affair is hushed up or kept as quiet as possible; the name of the "best citizen" never makes its appearance in the police court records. Still, we have people who are simple enough to believe the fiction that "the law is no respecter of persons." However, the police know better than that. The drunk and disorderly who is not numbered among the "best people" receives no favors from the police. He is made to feel the full majesty of the law, its letter as well as its spirit, there is no mincing of matters with him. The policeman must be very circumspect in his treatment of the "best people" for their petty infractions of the law; he must overlook their little offences if he expects to hold his job; and these same "best people" are the first to bring him to account for neglect of duty if he fails to enforce the plain provisions of the law when dealing with those members of society who are not "best people."

A very forcible illustration of the ethic which governs these "best people" in their relations with the officers of the law is contained in a news item that appeared in my daily paper a few days ago. Two special customs inspectors were compelled to sneak out of Windsor, Ont. in a round-about manner, and in disguise, in order to escape violent handling by a mob of the "best people" of that town, after being on duty at the custom house only about a week. There had been complaints of a great deal of petty smuggling being carried on across the Detroit river at that point, and these officers were sent by the Dominion government to investigate the matter and put a stop to it. The "best people" made no complaint that these officers had stepped outside the bounds of the law during the performance of their duties, there was no claim that they had done anything more than what the law gave them full authority, and even required them, to do. But it appears that they failed to exercise proper discrimination; they failed to recognize the subtle distinction that exists, or that should exist, between "best people" and other people; and, along with the common herd, some of the "best people" of Windsor were subjected to the indignity of being searched, and some dutiable goods that were found upon them were confiscated. This action caused such a storm of indignation among the aforesaid "best people" that the town of Windsor actually became too hot to hold the customs inspectors; they were compelled to suspend their duties and keep shady in order to escape violent handling from the people, and the proposition was advanced in all seriousness that if the officers were not recalled there

was great danger that they would be murdered. And yet, they had simply done their duty! Simply done what the law required them to do. The situation was explained to the revenue authorities at the seat of government and the inspectors were promptly recalled, but they had to sneak out of town like common thieves in order to escape the fury of the "best people." Their superior officers will no doubt read them a lecture on their lack of discrimination, and, hereafter they will probably be able to recognize the difference that exists between "best people" and those who are not "best people."

Now, it is not an uncommon occurrence for persons to be searched at these custom houses: in fact, it is quite an ordinary affair; and when the searching process is restricted to ordinary people the custom house officers receive nothing but commendation from the "best people" for doing their duty. Indeed, were the common herd to resist the searching process as forcibly as did the "best people," these same "best people" would be found on the side of the customs officers, upholding them in the discharge of their duty, and demanding that the outraged law should be vindicated. It is merely a question of going the wrong way; but, in their ethical aspects, such matters as this need a thorough readjustment, or else we must give up the hypocritical pretense of an universal ethic.

Some time ago, in my own city, a member of the demi-monde had the audacity to open an assignation house directly across the street from the Young Men's Christian Association building. There was nothing about the exterior of this house to indicate its character; everything about it was quiet and orderly, and the person who was not informed of the character of the house would never entertain a suspicion that it was anything out of the ordinary. But its location did not suit the ideas of the "best people." It did not appear that they were opposed to assignation houses in general, but they wanted to have them regulated and kept away from particular quarters of the city; and the idea that one of them should be permitted to flourish in such a close proximity to the Y. M. C. A. building was not to be entertained for a moment. The question was discussed, both editorially and by communications from "Rex," "Vox Populi," "Justice," "Yours for Morality," and a host of others, in the daily papers. It was argued that the sons of some of our "best citizens" were members of the Y. M. C. A. and regular habitués of the building across the street, and if this moral plague spot was allowed to continue in its present location the morals of these young gentlemen would certainly be corrupted and the objects of the Association be so much harder of at-

tainment, if not entirely defeated. The "best people" demanded protection for their sons from the contaminating influence of such pernicious examples; the officers of the law were exhorted to do their duty, and the house was closed up and the business removed to a less "respectable" location. Now, there is no doubt that the sentiment that impels men to bring up their children in a pure moral atmosphere is one to be highly commended; but from the point of view which regards the law as an instrument for the protection of morals, there is an element of incongruity about such affairs as this which would be laughable if it were not so sad.

In other quarters of the city are some of the very lowest dens of vice and immorality flourishing practically unchecked by the officers of the law. Around these plague spots may be found little boys and girls, sons and daughters of citizens who are entitled to the full protection of the laws, who are compelled, while engaged in their innocent plays, to witness exhibitions of the most revolting immorality and listen to the most revolting language day after day, and whose contamination, while growing up in this atmosphere, is a forgone conclusion. The parents of these children are poor, they are not "best people," and their poverty compels them to live in these low quarters because they cannot afford to live elsewhere, but the administrators of the law trouble themselves very little about their moral surroundings, and there is no agitation for the removal of the dens of vice which are contaminating the moral characters of future citizens of the state. Such cases as this are but exemplifications of the theory of human inequality, which many persons so fondly imagine has been abandoned, and they illustrate the fact that laws and governments are instituted for the exaltation of some at the expense of the degradation of others.

A short time ago one of these "best people" was arrested for wrecking a bank. While acting as its cashier he had appropriated the funds of the institution to his own use, and when the bank encountered the late financial squeeze it was discovered that this "best citizen" was an embezzler of many thousands of dollars. He was a very conscientious church member, and a great deal of sympathy was expressed for him in his misfortune (?)—none for the persons who were the losers by reason of his speculations; he was, of course, arrested, but he received very different treatment from that accorded to a common criminal. His bail was fixed at twenty thousand dollars, and he was unable to furnish it at the moment; but he was not thrown into prison in default of bail. Oh, no! He was one of the "best people!" See? He was

given time to secure bail, and an officer of the law was detailed to accompany him in his search and instructed to afford him every facility, consistent with the ends of the law, in his search for proper sureties for his appearance in court at the appointed day of trial. This gentleman kept up an unavailing search for bail, accompanied always by the representative of the law, for more than two weeks; and, finally, when it was found to be impossible to secure the amount of bail that had been fixed by the court, he and his attorneys went into court with a motion for the reduction of bail to the sum of ten thousand dollars, sureties for which sum the "best citizen" was prepared to furnish at once. The court heard the arguments in favor of the motion, and granted it; bail was reduced to ten thousand dollars; it was promptly furnished, and the "best citizen" was permitted to go about his business. He will, no doubt, be able to manufacture evidence enough before the day of trial to convince a jury of his peers that he is the victim of a conspiracy, and not an embezzler at all.

It would be a waste of space to point out the manner in which the law would have dealt with this man had he been a poor wretch who was guilty of stealing twenty-five dollars' worth of property, for the purpose of protecting himself or family from the pangs of starvation. Long ere this he would have been convicted and sentenced, and he would now be working out the penalty which the law imposes for grand larceny, behind the bars of the state's prison. The court would have been able to exercise no discretion in dealing with him; the law would have been applied impartially (?).

The ethical considerations which enable these "best people" to look with abhorrence on a common thief who steals a few dollars from another person, while permitting them to take advantage of the necessities of workmen to grind down their wages to a point far below that of respectable living, are most fearfully and wonderfully like those which animated the rulers of society in the days when workmen were all in slavery, and without prospect of emancipation; but there is this difference: There was no hypocrisy in the promulgation of those old-time ethics, while at present the entire social relation is nothing but a tissue of hypocrisy and falsehood.

The Carpenter of Nazareth had reference to these "best people" when he said: "Woe unto you, Scribes and Pharisees, hypocrites! for ye devour widows' houses, and for a pretence make long prayers: therefore ye shall receive the greater damnation." And the strangest part of the whole affair is that the institution which pretends to expound the ethics of Christ, the church,

is in close communion with these same Pharisees who "devour widows' houses," and occupies itself with manufacturing excuses for their unutterable iniquities towards God's children.

That salacious old hypocrite, Colonel Breckenridge, is one of our "best people," a pillar of the church, and he found no difficulty in persuading an eminent Presbyterian Doctor of Divinity, Rev. Dr. Paxton, of New York, to violate the law by suppressing his marriage record, and even commit perjury by making a false record, so as to enable him (Breckenridge) to carry on his iniquities the more easily. And this Paxton, this Doctor of Divinity, is so utterly shameless a person as to rush into print in defense of his friend "Willie," with the plea that his failing is a natural one, and he could not help his lecherous propensities if he tried! Which may be all true enough, but where is the Christian ethic that permits a minister of the gospel to defend such doings? And where is the minister who, if the person were one of the common herd, would not most unqualifiedly condemn such acts as those committed by Breckenridge? And these are the representatives of the institution that is busying itself with carrying the gospel of light to the benighted inhabitants of heathen countries!

Some time ago it was my pleasure to listen to a lecture delivered by a Hindoo monk, the Brahmin Swami Vive Kananda, who was a delegate to the World's Congress of Religions in Chicago last summer. He exposed the iniquities of the missionary business in India with a master hand; but what impressed me the most forcibly was the explanation of the attitude of these so-called heathens toward the real ethics of the Christian religion. He said: "We want missionaries of Christ. Let such come to India by the hundreds and thousands. Bring Christ's life to us, and let it permeate the very core of society. Let him be preached in every village and corner of India. But," he said, "if your missionary does not represent Christ, what right has he to call himself a Christian? Let Christ be preached in every village in India, but don't have your missionaries choose their profession as a means of livelihood. Let them have the call of Christ. Let them feel from within that they were born for the work." This is important testimony from the mouth of one who is competent to speak by authority; it makes it apparent that the real ethics of Christianity are not unacceptable to the Hindoos, at least, and that the same causes that have operated to make Christianity a failure here are the ones which operate to make it a failure abroad.

While reflecting on these words of Kananda's, I thought of Christ's injunction to

his disciples: "Provide neither gold, nor silver, nor brass in your purses; nor scrip for your journey, neither two coats, neither shoes, nor yet staves: for the workman is worthy of his meat." And then, again, I thought of his words to the Scribes and Pharisees: "Woe unto you, Scribes and Pharisees, hypocrites! for ye compass sea and land to make one proselyte; and when he is made, ye make him two-fold more the child of hell than yourselves."

It is claimed that Christianity, the real article, is competent to settle the labor problem and establish correct social relations on earth, and there can be no doubt but the claim is sound; but when workingmen are asked to put their trust in the organized representatives of Christianity, the Churches, and depend on them to secure justice between man and man, they have a right to scornfully reject the invitation; ay, they would be less than the intelligent human beings that they are if they did not reject it, because the Church is a prostitute, she does not represent Christ; like the ruling classes she has adopted two ethics, she preaches Christian ethics for the poor and worldly ethics for the rich. What society now needs above all things is a new ethic; one that shall be universal in fact as well as in theory, one that shall condemn the stock and money gambler, the monopolizer of natural resources, the big thief who steals the bread from the mouths of the families of his employes by increasing profits at the expense of wages, equally with the poor devil who gambles in lottery tickets, or the petty thief who steals to avoid hunger. We must have a new standard of morality, and if organized Christianity is not competent to give it to us, so much the worse is it for organized Christianity. Organized society, when established on a democratic basis, when affecting to dispense equal benefits to all of its members, cannot maintain a double standard of morality; it is an utter impossibility; it is thoroughly incompatible with the genius of democracy. When we have a single standard, when the actions of every single member of society are measured by the same rule, we have democracy; when we have a double standard, when the actions of one portion of society are measured by one rule, and the actions of another portion by some other rule, we have oligarchy, tyranny, aristocracy, or some other bastard form of government, although it may masquerade under the title of democracy. It is time to throw off the mask, to drop all hypocritical pretense; it is time that workingmen began to recognize the fact that henceforth it must be with us, two ethics and a nation of aristocrats and slaves, or one ethic and a nation of freemen. And this conviction is beginning to

force itself upon the minds of our plutocratic rulers, they are beginning to throw off the mask of hypocrisy, as is indicated by the remarks of Senator Wolcott, while speaking on the Allen resolution anent the Coxey movement in the United States Senate a few days ago. Senator Wolcott said: "I believe the time has come when those of us who are in public life ought to begin to cultivate more regard for the perpetuity of republican institutions and to pander less to that misguided portion of the labor vote whose labor is with their threats and never with their hands. It is time that we stood for American manhood, for the right of every man to work if he wants to, if it takes the whole army of the United States to enable him to do so." Which all sounds very nice, but his estimate of the "perpetuity of republican institutions," and the real animus of his remarks, appeared in what follows: "It is time that we had the courage to stand together against this socialism, populism and paternalism which is running riot in this country, and which must end—if not crushed—in the destruction of the liberties which the laws give us, liberties which should be dearer to us than life itself." There is the unmistakable gage of the class battle, the battle for the maintenance of two ethics as against one ethic for the government of society. Upon which side are workingmen going to elect to cast their strength? The press dispatch states that "a number of the senators took the pains to go to Senator Wolcott on the floor, after he had concluded his remarks, and express their approbation of what he had said." Verily society is now sadly in need of a new ethic.

### SOCIALISM AND ITS CRITICS.

BY W. H. STUART.

In the April MAGAZINE Mr. W. P. Borland attempts the hopeless task of discrediting the socialist theory of value, a theory that is based on the assumption that wealth, economically considered, is the product exclusively of labor. Admit the claim, and it follows logically and inevitably, that labor is entitled to the whole product. This theory was first stated definitely by Adam Smith, although his further utterances were not always consistent with the theory he enunciated. Ricardo more fully developed and established this theory. But Adam Smith was not the first economist who perceived that labor produced all wealth. More than a century before "The Wealth of Nations" had appeared, John Locke had declared his belief that at least 99 per cent. of all wealth was the product of labor. W. Petty and other economists before Smith's time had reached similar conclusions. Indeed, when a definition of the term

"wealth" was reached, no other theory was possible. Consequently the theory is generally accepted among all schools of political economy. Even Henry George admits that wealth is the product of labor applied to land, although like other bourgeois economists he defends exploitation of labor through interest by introducing a third factor as an auxiliary in production, viz: capital.

But to Karl Marx must be credited the work of scientifically and exhaustively analyzing this theory, and following it to a logical conclusion. By his masterly analysis of capitalist production he showed conclusively, that capitalist production is based on the exploitation of labor; that while labor is the sole producer of wealth, it nevertheless receives of the product in the shape of wages only sufficient to enable the producer to maintain an existence and reproduce others to continue the process.

Karl Marx says:

The wealth of those societies in which the capitalist mode of production prevails, presents itself as an immense accumulation of commodities, its unit being a single commodity. A commodity is in the first place, an object outside us, a thing that by its properties satisfies human wants of some sort or another. The nature of such, whether, for instance, they spring from the stomach or from fancy, makes no difference.

Every commodity has two values, a use value and an exchange value. The utility of a thing makes it a use value, but this utility is inherent in the thing itself, and is limited by the physical properties of the commodity, having no existence apart from it. This use value of a commodity is independent of the amount of labor required to appropriate its useful qualities. "Use values become a reality only by use or consumption." Exchange value, on the contrary, has no reference to the properties of the commodity. Exchange value presents itself as the proportion in which values in use of one sort are to be changed for those of another sort, a relation continually changing with time and place. Use values always present themselves to us qualitatively, differing from one another, but as exchange values they are merely different quantities, and consequently do not possess an atom of use value. If then we leave out of consideration the use values of commodities, they have only one quality left, that of being products of labor, as Marx says:

We see then that that which determines the magnitude of the value of any article is the amount of labor-time socially necessary for its production. Commodities, therefore, in which equal quantities of labor are embodied, or which can be produced in the same time, have the same value. The value of one commodity is to the value of any other, as the labor-time necessary for the production of the one is to that necessary to the production of the other. As values, all commodities are only definite masses of congealed labor-time.

In short, the socialist theory is, that nature furnishes free the raw material of use value, and that human labor, and human

labor only complete's the process of turning the raw material that nature supplies into "wealth."

If this theory is true, then it logically follows, that the idler, or the non-producer, is either a parasite or a robber, and a system in which the parasite and robbers are enabled to exploit the actual producers is an unjust one. It is the great merit of "Capital," by Karl Marx, that the process by which the laborer is defrauded, is laid bare and exposed with a dialectic precision and a thoroughness never equalled. Against the socialist theory, the sycophantic apologists of capitalist exploitation have waged bitter warfare. But socialism is in the air; it influences legislation everywhere. Its influence is as potent in Kaiser cursed Germany, as in democratic America. The cause of the toiler is in the ascendant. Everywhere labor is demanding its rights, its rights to the wealth it alone produces. The right of the capitalist non-producer to absorb all surplus wealth over the cost of the maintenance and reproduction of the real producer is everywhere challenged. Capitalism is doomed. And why not? What is it that socialism demands? This: That the toiler shall control the tools necessary for the production of wealth, the tools that his own labor has supplied. Socialism demands that the divorce between the tools and the toiler shall cease. It points to the historical fact that for centuries before the advent of the capitalist system, the artisan owned his own tools. The cloth manufacturer *e. g.* owned his own loom, the cloth was woven by his own hands and by those of his family, he disposed of his product directly to the consumer, no middleman interposed to absorb part of his labor; but with the advent of manufacture, the invention of the power loom, and the use of steam as a motive power, conditions entirely changed, immense factories arose, the hand loom weaver was forced to work for the capitalist for a wage that represented, not the value of his labor, but his necessities. Socialism demands that this condition shall cease. It is evident, however, that we can not return to the old hand tools and the isolated system of production. The machinery for making shoes can no longer be contained on the bench of the isolated worker. It requires an immense factory fitted up with costly labor-saving machinery, and a minute subdivision of labor that renders technical skill almost unnecessary. As, therefore, it is evident that the individual worker can no longer control the tools of production, socialism demands that these tools shall be owned collectively; that they shall no longer be controlled by a non-producing class, who use them to defraud the real workers of the product of their labor, and that enables the exploiter to pile up unnecessary wealth,

while their unfortunate victims eke out a miserable existence in the brutal competitive struggle for a chance to work.

In a word, socialism demands that all the instruments and means of production shall be owned collectively. Its motto is: The tools to the toilers. The produce to the producers!

With this digression let us return to Mr. Borland and his criticisms. And let it here be understood, that to refute Marx's theory of value, it must be shown that in the production of wealth there are other factors besides nature and human labor; these factors must be indicated and their existence proved, and some proportion given of the part played by such factor or factors in production, what proportion of the product such factors are equitably entitled to claim.

After a very intelligent presentation and definition of use and exchange values, showing that the labor time expended on commodities would be the basis upon which all exchanges would be effective in the socialist state, Mr. Borland says:

That is, providing the socialists were able to harmonize their theory with the *incontrovertible* facts that are all the time cropping up to give it the lie, which not being the case at present, is no more likely to be after socialism had become established.

Let us see what these *incontrovertible* facts are. He instances the fact that when an object of considerable utility is rare upon the market, it increases in value until the extra profit derived from its production attracts the productive agents of society, with the result that a glut ensues, and an equilibrium is finally established with the prices of other products. Very well, an equilibrium is restored and the theory of value is not affected. Besides, in what way would that condition of things affect values under socialism, where all labor would receive the same reward? or even if labor was paid according to the individual product, the scarcity of a certain commodity would enhance temporarily the proportion going to the producer, such temporary aberrations of value do not affect the general law of value.

Again, he says.

Let us take a national object, say a fruit. We may suppose that it costs nothing to take possession of it, that it presents itself at haphazard to the passer by, who has only to stretch forth his hand and take it without labor. From a socialist point of view—and Marx is positive on this point—"A use value, or useful article, has value only because human labor in the abstract has been embodied or materialized in it."

Mr. Borland's object here appears to show that Marx is contradictory, that in the case of the fruit there was no labor embodied in it, yet it had value. But Marx's statement just quoted related to use values derived from labor, as say a coat, or a barrel of flour, for he states that "a thing can be a use value without having value (i. e., exchange value), such as air, virgin soil, natural meadows, etc.

If fruit was so plentiful that it could be picked anywhere without labor, it would have a use value, but no exchange value whatever, and Mr. Borland's remarks as to how its value would be affected through scarcity and the desire to possess, is beside the question altogether; where it requires labor to produce it, it will like all other commodities derive its value from the labor expended in its production.

Mr. Borland asks: "And who can rightly contend that the value of a diamond bears any relation to the social labor time embodied in it?" I can assure him confidently that the diamond has no other value than the labor time embodied in it. Marx says:

Diamonds are of very rare occurrence on the earth's surface, and hence their discovery costs on an average a great deal of labor time. Consequently much labor is represented in a small compass. Jacob doubts whether gold has ever been paid for at its full value. This applies still more to diamonds. According to Eschwege, the total produce of the Brazilian mines for the eighty years ending in 1823 had not realized the price of one and a half years' average of the sugar and coffee plantations of the same country.

Mr. Borland says:

Suppose there is but one diamond on earth and that its possessor has secured it without effort, has merely stretched forth his hand and picked it up. There is no labor time embodied in the diamond, will the socialists say that in receiving the price of the diamond its possessor is guilty of robbery.

The question is a childish one. In the first place, if there had never been any diamonds previously discovered, the one picked up would have no value. What gives diamonds their value is the exact knowledge of their physical properties; their great antiquity as an article of value and adornment; their rarity and the consequent great amount of labor expended in the effort to discover them. Imitation diamonds of paste can be procured at a small part of the cost of real diamonds, the difference between which can only be detected by an expert, but their difference in value is the difference in labor time necessary to produce each kind. If, for instance, a man found a diamond on the street, that fact would not affect the value of diamonds, which would still be the amount of socially necessary labor time requisite for their production. But suppose it was a common thing to pick up diamonds promiscuously, say that 25 per cent. of diamonds were found that way, their value would depreciate 25 per cent., if 50 per cent. were so found, their depreciation would be in the same ratio, and if diamonds were picked up everywhere without labor, they would have no more value than pebbles. But, as a matter of fact, fruit is not picked everywhere without labor, nor are diamonds found on the roadside, but both represent in their production labor time.

Mr. Borland appears to argue that the scarcity of a thing gives it a value apart from any labor expended upon it. This is

mere nonsense. The scarcity of a utility or use value is an evidence that great labor is required for its discovery or its production. The fact is, the illustrations offered by Mr. Borland are frivolous in the extreme, and have no bearing whatever on the question of the composition of values under practical and normal conditions. He is compelled to assume impossibilities in order to make any showing whatever. Of course, scores of volumes have been written by the paid apologists of labor exploitation. But I really think a fellow wage slave like Mr. Borland might be engaged in better business than in repeating the specious and frivolous arguments of the paid advocates of labor exploitation. There is some excuse for those who are paid to do the work—there is none for him. Besides, the arguments he offers are now relegated to apologists of the third class. The most eminent of the paid apologists for capitalism base their defense of labor exploitation on something altogether different, namely, on the claim that capital is an independent factor, or at least an auxiliary in production. This is Henry George's theory, although he bases the justification of interest on the reproductive forces of nature and the element of time, giving a value to capital—owing to equalization of advantages—quite distinct and separable from labor. For a criticism and refutation of this theory I refer the reader to my article in the MAGAZINE for May, 1893.

But the argument of the bourgeois economist is, that capital is a distinct factor in production. It is admitted that labor produces capital. But some producers abstain from consuming all this wealth, and devote their "savings" to productive purposes, and "interest" is the reward of their "abstinence."

The Austrian theory of value is also based on "abstinence" as the starting point of capital. On this abstinence theory, the brilliant socialist writer, Mr. E. B. Bax, says:

Economists, in the vain search for a scientific explanation of interest on capital, lighted upon the naively brilliant idea that interest was the reward a beneficent nature had provided for "thrift." Now, as every small boy knows, if he abstains from eating his cake, or a portion of it, one day, he has the pleasure of consuming the same another day. But the only reward of the small boy's virtuous thrift is the future pleasure of consumption, as against the present or past. With this he has to be satisfied, as the cake does not increase or multiply with keeping. But we are asked by the Economists to believe that the virtue of the small boy, like Sampson's locks, grows with his growth and strengthens with his strength, in such wise that when he becomes a big capitalist he has acquired proportions entitling it to a reward altogether incommensurate with what satisfied it in its earlier stages. Now he expects his cake, under the abstract expression "commodity in general" or its concrete symbol money, to grow by keeping to indefinite proportions. Like the good fairy's cake in the nursery tale, so far, so good; but here the uninitiated stumbles across the puzzling fact that to the carnal eye the abstinence and the increment

do not run hand in hand together, but that the abstinence lags behind the increment, and finally stops altogether, and that, too, just at the time when the pace of the increment is accelerating by "leaps and bounds." To the carnal eye, for example, the abstinence of a Nathaniel Rothschild or a Samuel Morley is below the *minimum visibile*. The unfortunate student of orthodox economy is thus driven to accept the Economists' assurance on the strength of that unsatisfactory surrogate the "eye of faith." Given a causal relation between abstinence and increment, and he naturally expects to find *ceteris paribus*, a progressive increase in the cause to precede or accompany a progressive increase in the effect. Experience, however, shows the reverse. What, then, becomes of abstinence as a scientific *raison d'être* of interest? Surely it is something like eponerity for a doctrine which has at its basis such childishness as this, to arrogate to itself the name of science, as is done by the orthodox economy.

Mr. Bax further points out that "profits" are divided by the Economists into three elements: (1) wages of superintendence, (2) indemnification for risk, (3) reward for abstinence. He observes with sarcasm, "that 'wages' of superintendence becomes greatest when the capitalist ceases to 'superintend';" and the indemnification for risk reaches its highest point when the possessor of wealth can afford to defy all risk with impunity."

That sophists and sycophants should invent such excuses for robbery is not surprising. But that intelligent workers, the victims of such a system of exploitation should repeat parrot-like the sophisms of their masters, is certainly discouraging. There is no use being mealy mouthed about terms, but it may be set down as true, that the man who defends exploitation of labor by means of rent of land, or interest on capital, is either a sycophant apologist for the exploiting classes, or an ignoramus—either a knave or a fool.

Here I am reminded of a case often presented by defenders of our present system: It is this: A man works industriously; is saving and prudent, accumulates say, a thousand dollars, which he invests in machinery, hires men, increases his business, employs more men, until he has finally hundreds in his employ and accumulates a fortune by the profits from his business, and the the question is asked confidently, "has not such a man acquired his wealth honestly?" The answer is no! He has acquired his wealth by withholding from labor the full equivalent of what it produced. Slavery illustrates this case clearly. For instance, say that instead of investing the thousand dollars in machinery, he had invested that amount in a slave, he sets the slave to work, and with the profit derived from his work, buys another, and another, until he has hundreds producing wealth for him and acquires an immense fortune thereby. As we are all agreed that chattel slavery is wrong, we all admit that the gains of the slave owner represent mere robbery of labor. Now the two systems are precisely parallel, the

slave owner uses force, he provides his slave with food, shelter and clothing and retains all the surplus product of his slaves. Whereas the capitalists use fraud, takes advantage of a system that compels the wage slave to dispose of his labor, under a *fectio juris* of "free contract." That is; the capitalist goes through the farce of bargaining what portion of the product will be returned to the laborer in the shape of wages. But every intelligent student of Economics recognizes that the minimum amount the workers consent to live upon, decides the "wages" they will receive. So that the wage slave has the advantage over the chattel slave, that he can change his master; instead of being the slave of one man, he is the slave of a class—the capitalists. Our principal advantage over the chattel slave is that we have insisted on a higher standard of living; insisted upon educating ourselves, an extravagance that our masters at one time vigorously protested against. We have, therefore, shared somewhat in the advancement of civilization and intelligence, and in time, will perceive how we are degraded and defrauded by a system which compels us to engage in brutal competition with our fellows for the privilege of gaining access to the tools of production our own labor created, instead of owning those tools in common, ourselves.

But, to return to Mr. Borland and his criticism, which I am sorry to say continues in a carping and trivial vein. For instance, he endorses my advice to those subscribers of the MAGAZINE who fail to read it, and remarks thereon:

I am led to wonder if Mr. Stuart is not in a position to take some of his advice to himself. Who is in the worse position, the person who reads not at all, or the person who reads in so superficial a manner as not to know what he has read? I candidly assure Mr. Stuart that, so far as I can remember, I have never quoted a line or a word from Bax's "Religion of Socialism" in my life.

This style of criticism is rather "small potatoes." The head and front of my offending is, that I credited a rather copious extract which Mr. Borland gave, to Mr. Bax. I was mistaken, and it is not of the slightest consequence who wrote it. Nor has Mr. Borland any right to assume that I read it superficially; on the contrary, I read it very carefully.

He also carps at my definition of the word "religion." He informs me the word has a very comprehensive meaning, as: "sense of duty; conscientiousness; sense of obligation." Quite true, but I used the term in the sense that is almost universally attached to it, viz.: our relations to a supposed supreme being. In that sense, socialism is neither religious nor irreligious.

I assure Mr. Borland that I am quite familiar "with that idea of Marx, that the religious system of a people always answers

to a definite economic category," and Marx's "idea" may be a correct one, but it remains an "idea" which may be accepted or rejected; it forms no necessary part of the socialist theory. It is quite evident to me that the belief in the existence of a supreme being, or in the existence of a divine revelation, is not dependent upon the form of any economic system only in so far as a better economic system may make it possible through better education and higher culture to arrive at truth. He says further: "As for Mr. Bliss, he may be good authority on Christian socialism, but Mr. Stuart surely knows that the Christian socialists are not orthodox." I assure Mr. Borland, on my honor, I didn't. An "orthodox" socialist is one who believes in the collective ownership of the means of production under a democratic form of government, and whether he is a Mohammedan, a Christian, or an atheist, does not in the least affect his "orthodoxy" as a socialist. Again: "Mr. Bliss is no more an authority on socialism than Mr. Bellamy." Quite true; they are both, however, excellent authority on socialism. And again: "The position of Mr. Bliss in the socialist movement is well known. He is even 'damned with faint praise' by the *Twentieth Century* for continuing to work such a 'barren field' as he is in." The implication intended by Mr. Borland being, that the *Twentieth Century* considered socialism and Christianity incompatible. Nothing of the kind was intended. Here is what the *Twentieth Century* did say:

Rev. W. D. P. Bliss issues a New Year's edition of "The Dawn," organ of Christian socialism. We have often felt that Mr. Bliss was working a barren field, for while the founder of Christianity taught the principles of socialism, the organization itself is too often the defender of capitalism, the apologist for usury, and the dispenser of that charity which is "as sounding brass and tinkling cymbal." Yet, the growth of socialist sentiment in the church is now very rapid, and if the editor of "The Dawn" can bring those of its members to practice the fundamental doctrines so long overlooked by the church, his work will not be in vain.

As Mr. Borland considers the *Twentieth Century* the leading socialist organ of this country, and as the editor is one of those whom he considers "the only logical socialist," I hope he will now be satisfied that Christian socialists are eminently "orthodox."

I quite agree with Mr. B. that "society is not going to accommodate itself to the views of either the Blisses or the Baxes who may constitute but a small part of it (socialist society)." There isn't the slightest doubt but "that there would always be some persons who would fail to see things as those gentlemen saw them, and there is no evidence that they would apprehend things differently than they do now." Quite true, indeed, with the qualifications I have already made regarding the change an improved social system might effect in our

ethical or religious ideals, which suggest the thought that perhaps the bugaboos Mr. B. raises in regard to the new social system are as unnecessary as they are ridiculous.

Mr. Borland instances the persecution of the Mormons as an evidence that religious bigotry has not yet died. But the persecution of the Mormons in late years is not on account of their religion. The objection against them has been on moral grounds—against the practice of polygamy. This is a practice that all civilized nations are opposed to, both Christian nations and those that are indifferent or hostile to religion. Mr. Borland draws my attention to a movement now "immensely active" in this country, and that people are not yet so weaned from the desire for persecution, and that it is out of such material the future co-operative commonwealth is to be formed.

Yes, I acknowledge there is yet room for improvement. Mr. Borland himself has furnished an example of how ready people are to arouse religious prejudice when it suits their purpose. But I assure Mr. Borland that the editor of this magazine has voiced the sentiments of every socialist in regard to the movement referred to. It is not too much to claim that under an economic system where education will be universal and the brutality engendered by poverty and ignorance obliterated, that religious persecution will entirely cease.

Another of the *incontestable facts* that tell against socialism, according to Mr. B., is that "the Australians who have started a socialistic community in Paraguay refuse to accept persons whose morality is doubtful. A socialistic colony is now being started in Greensburg, Ind., and its projector advertises that "none but persons of good moral character will be admitted," upon which my intelligent critic remarks: "Now, it seems to me, that states the whole question for socialism." That is to say, that unless socialism can take the worst elements of society—the thieves, murderers and thugs, and make a success of such material for a socialistic commonwealth, that socialism is a failure. This is intelligent (?) criticism with a vengeance! Because the projectors of small socialistic experiments, the starting of which is universally discouraged among scientific socialists, insist that their hazardous and uncertain experiments shall not be handicapped at the start by bad material, we are to assume that socialism would only be successful if composed exclusively of the elite of society. This is an argument that might be used against the anarchism, but not against socialism. Socialism will remove the causes that develop criminals, it will make it easy for everyone to provide an honorable and ample living for himself and family; only a fool would be guilty of theft when moderate exertion

will insure an abundance. Mr. B. adds: "But when our moral natures are properly developed, that is sufficient by itself, and socialism has no *raison d'être*," which is mere childish nonsense. I have shown in a former article that our moral natures can never be "properly developed" under a system that consigns the great mass of the people to lives of bitter toil and poverty, and the necessary result: ignorance, brutality and fanaticism.

Mr. Borland tries to bolster up his silly statement regarding the supposed increase of power of majorities under a socialist regime. He quotes my statement that: "The majority, providing it is strong enough to enforce its action, can now absolutely prescribe what the people shall eat, drink and wear, and what religion shall prevail." Upon which he remarks: "This is a remarkable statement, to say the least, and I assure Mr. Stuart he is far from right. The power of the majority in this country is now limited by a fundamental law." (Of course, but how long would a "fundamental law" remain in force against the will of a majority? Mr. Borland knows as well as I do that the will of the majority under a democracy is as absolute as the will of the Czar of Russia. Any limitations, constitutional or otherwise, designed to prevent hasty legislation, can be abrogated whenever the majority so desire. But, assuming the converse to be true, how does Mr. Borland know that the same limitations would not prevail under a social democracy? Will he kindly explain why the elimination of private capital would make any change in majority rule? Has the assumption by the government of the carrying of the mails or the establishment of free schools increased the power of the majority?

The fact is, Mr. Borland, in his eagerness to make a point against socialism, made a very foolish statement, in limiting the power of the majority, under our present form of government; any school boy of average intelligence knows better. I again assure him that no extension of the present power of the majority is contemplated by socialists, or would be possible. Nothing better illustrates the impregnability of the socialists' position than the extraordinary arguments brought to bear against it by its eager opponents. If Mr. Borland really believes that the adoption of a co-operative system of production, by abolishing poverty and making education universal, would tend to turn us into beasts, ready to cut one another's throats, and that our benign (?) system of private capitalism is the only thing that prevents such a condition, then he is right in opposing socialism, but such a belief discredits his intelligence, and the ranks of the single-tax is the proper place for him to remain. *There requiescat in pace.*

It is a continual source of amazement to socialists to discover the crass ignorance that prevails among otherwise intelligent people on the subject of socialism. This ignorance is not confined to the unintelligent and superficial, but is shared in by scholars, and even professors of political economy. When, for instance, a superficial writer like José Gros criticizes organized socialism, tells us that "we don't want economic rent determined by any set of government officials. \* \* Nor do we \* \* want wages determined by government officials. \* \* We don't want plutocracy in any form, not even one composed of socialistic saints," and such like twaddle, *ad infinitum*. When the very object and aim of socialism is to abolish economic rent, abolish wages, and make plutocracy impossible, we are not surprised that Mr. Gros knows nothing about socialism, nor about economics beyond the idea that private ownership of land is wrong, don't claim to know anything, and is, perhaps, proud of his ignorance. Nor, indeed, does Bro. Gros need to know, his accurate and complete knowledge of "God's will" and of Divine laws," upon which subject he is *au fait* and speaks *ex cathedra*, renders any knowledge of economics on his part quite superfluous. But when he tackles socialism, upon which subject he is not inspired, we smile at his innocent prattle with good natured contempt. But what shall we say when the New York *Evening Post*, that is noted for its literary ability and scholarship, said editorially, some weeks ago: "There are two great assumptions at the bottom of the theory of socialism. One is that the resources of the state are mysterious and inexhaustible, and the other is that the present well-to-do class would under socialism continue in existence, and not only pay workingmen whatever wages they asked, but joyfully meet all demands made on them in the shape of property and income taxes, and buy all the state goods, while the laborers had short hours, steady employment and a fair share of the luxuries." Here is a scholarly ignoramus who prates of a "well-to-do class" of idlers, who "pays workingmen wages," buys "all the state goods," pays the "property and income taxes" under a socialist regime.

Then the criticism of a French economist, M. Yre Gytot, whose idea of the socialist theory of value is, that mere muscular energy of itself, and under the most unfavorable conditions, is what produces wealth most abundantly. Then the criticisms of Prof. Fawcett, of England, whose work on political economy is considered a standard, says seriously: "If the state divided all the lands among the inhabitants, there would gradually arise the same inequality of wealth which exists now."

Certainly there would, but no one outside of a lunatic asylum proposes any such plan of "dividing up" either the land or anything else. With the same idea in his profound noddle, Mr. Joseph Cook, the philosopher of transcendentalism, says vehemently: "Rather than give property Monday morning into the control of men who, before Saturday night, will have produced inequality again by their own spendthrift character, we will see to it that in this country sterner laws are made than now to repress heresies and demagogues under universal suffrage."

Then there is Prof. Goldwin Smith, of international fame for ripe scholarship, who issued a little brochure three or four years ago, under the title "False Hopes," in which he traced the rise of socialism, single-tax, trades unions, strikes, etc., to a great extent, to the decadence of religion (?). There's scholarly profundity and discernment for you! The absurdity of many of the objections and arguments urged against socialism Mr. Borland sees as clearly as socialists, yet he himself urges others that are equally as frivolous.

The works of Henry George himself show an ignorance of other schools of economics that is astonishing. What would we think of a man who wrote a book advocating a new theory of the origin of specie, which claimed to have "covered every point and met every objection," but which completely ignored the works of Darwin? and yet that is what George has done. He has wrote a work and offered it as the "sovereign remedy" for all social ills, and has yet ignored the works of Karl Marx and the socialist school. Nor is there any evidence whatever that George ever read one of these works. On the contrary, the internal evidence of "Progress and Poverty" negatives the assumption. In the preface to that work he couples the names of Proudhon and Lassalle in a manner that shows he probably never read a line of either. The contribution of Karl Marx to political economy can no more be ignored than could Darwin's in biology. Karl Marx's "Capital" marks an era as distinct in political economy as does Darwin in another science. To this ignorance of current political economy may be traced George's misconception of the meaning and function of capital. He is entirely oblivious of the extraordinary difference effected when wealth used for the production of more wealth (his definition of capital) is used by the owner of that wealth to increase his personal product, or when used for the purpose of extracting surplus value from the labor of others.

His other extraordinary misconception of the difference between the economic rent and monopoly rent, i. e., the difference between rent under a state of freedom, as

contemplated by Ricardo's law of rent, and that which obtains under a system of general monopolization of land, such as now obtains, reduces his whole theory to an absurdity, which will be referred to by future economists as the *fin de siècle*—economic "fake" *par excellence*.

## INDUSTRIAL FREEDOM.

BY JOSÉ GROS.

It has taken about forty centuries of post diluvian civilization for men to conceive the two words with which this article is captioned. We don't remember of any historical period in which that conception was preached by any set of men, or grasped in any distinct form by any group of reformers. It is hardly over ten years old, that conception. And how few do yet understand the real meaning of those two words—Industrial Freedom! To those who understand the fullness of that motto, to them the motto implies a radically new departure in human affairs, a new leaf in the history of humanity, new fundamental perceptions of life, a peaceful revolutionary process such as history has never had, such as men never even dreamed, unless it is a few clear minds to-day. And the dream is far from wild, because it rests on the simplest methods conceivable and takes full cognizance of all law in nature and in ethics, in the physical as well as in the moral order. When that new departure is to commence, that no man can tell. It will all depend on human volitions, because, while the final triumph of truth is inevitable, God is not going to bring it about until men co-operate with him. He can wait just as long as men see fit to wait. And God wants free co-operation, not the forced one of socialism.

We hear a great deal, in our days, about social and economic evolution, by which it is intended to convey the idea that, bad as it is, our social and economic status, it constitutes an advance over that of previous civilizations, indispensable to any substantial social growth in future human developments. Are we sure that that is a correct view? It flatters our human pride. There is no doubt about that. It is not pleasant to imagine that we have, all along, been lounging in the wilderness of human fancies, going to and fro through the interminable forests of our own conceits, and yet, now and then we should look at the facts of history such as they are. For instance, let your mind rest a few moments on the social reconstruction of William the Conqueror, that ideal tyrant, soon after he overcame all resistance and became the master of England.

For all practical purposes William was a first class socialist, as much so as needed in

that historical period, short of industrial freedom. And please remember that there is no middle term between industrial freedom and some sort of socialism. And remember too that so far all civilizations have been but forms of government—class socialism. We mean government giving to a class the privilege of handling the other classes, directly or indirectly, by hook or crook.

The civilization of to day is essentially government corporation socialism, worse, if possible, than any other. Perhaps state or national socialism would eventually become more fatal yet; but, as the matter has never been tested, we should neither say yea nor nay on the subject. Well, the socialism of William the Conqueror left 13,000,000 acres of land as common property where the common people could obtain fuel and pasture for their cows, pigs, &c. And nobody willing to work needed to loaf in the dark ages of feudalism, in England or anywhere else. Not even in the vast empire of Persia 25 centuries ago were men forced to beg for labor in vain, as in our days, close to the portals of the twentieth century of Christian progress, so called! It is bad enough to have to beg for labor. It is far worse to be in danger of having no work even if we beg for it!

The writer is old enough to remember that forty years ago, in the old effete nations of Europe, in the southern sections anyhow, healthy tramps and city loafers were unknown, except in certain very poor and remote localities, or after warlike developments. It was reserved to us, the richest nation on earth, by God blessed with higher blessings than any other nation, and that on top of three centuries of popular education and political freedom, it was reserved to us to evolve the sight of large numbers of male adults, able and willing to work, but unable so to do! And that has been the case for over twenty years, with greater or less intensity every now and then, with profound peace all along, with famous crops year after year. And that is what we call social or economic evolution! Are we sure that that is not dissolution?

Now let us see. About 13,000,000 acres of common land for three or four millions population in England six centuries ago, in the dark ages. Not even free roads for most of our 70,000,000 free (?) American citizens, in our enlightened age, because half the breadth of the road belongs to the land holder in front, even if he never saw the land, and you have to move when in the road. Seldom anybody forced to beg for labor in vain under peace and fair crops in the old nations. Quantities of such people to-day and during many previous years in the most enterprising nation that ever lived, with the greatest natural domain

that a nation ever had! Is that evolution? Is it not rather dissolution? And why all that? Principally, anyhow, because of land concentration in the hands of the few carried to a greater intensity than ever before. Never before can you find a continent like ours more completely under the direct and indirect control of 50,000 men, the masters of 70,000,000 population. And please notice that not even the farmer free from mortgage, or the city worker with a home free from debt, can claim to be a real land holder. The reason is very simple. We have at least fifteen billions of dollars in public and franchise corporate securities, a colossal general mortgage on all small fry land holders and the honest labor of all workers.

The chariot of civilization has always been rolling up and down hill. Periods of greater or less prosperity have been followed by others with greater or less hardships. Only that such a prosperity has always been concentrated with the few and the hardship with the many. The periods of hardship have invariably coincided with great land concentrations. Those of prosperity have resulted from relative land subdivision. To be sure, we never had any solid prosperity, much less an ideal land subdivision.

Look at that Rome which gradually exhausted and conquered Carthage. The latter republic was cursed by large landed estates. The former contained yet a good proportion of small real freeholders. Land subdivision prevailed over land concentration. As long as the former continued, so long do we find the Roman armies invincible in war, and the republic prosperous and wealthy within, all relatively speaking.

And what about that old France, overrun by the armies of England when the latter had evolved a certain degree of land subdivision, under mild feudal rules, while France was groaning under large land concentrations and a harsh feudalism?

From that turn your eyes to revolutionary France, when land subdivision had taken the place of land concentration. You see then the French armies entering all the capitals of Continental Europe, victoriously promenading in all directions, except England, saved by her turbulent channel and insular position.

And what about those small but powerful republics in Northern and Middle Italy, sprung up from the ruins of the Roman Empire? Some of them supported in plenty a population of 800 per square mile, while we, the grand nation, cannot even support 25 per square mile, although our modern inventions have multiplied by 30 the productive power of the average man. Under land subdivision we could support in plenty an average density of 400,

even with the old plain tools. Bonanza farms, or great land concentration, mean the wilderness in the country on one side, and the wilderness of large cities on the other, poverty in the latter coupled with great wealth, and nothing but poverty in rural districts. It means a very low average product per acre, wretched cultivation, slaves in the fields and slaves in the cities.

Could we scape any such developments by simply carrying land concentration to the highest point, under public officers, with piles of bureaus right and left trying to discover the actions and reactions of the very laws of nature which the system would repudiate? Why should official land concentration and official capitalism be any better than the capitalism and land concentration to which we can trace all the disasters of human societies?

We all know that on one hand the small sin evolves or invites the big one. There is some form of evolution for you, evolution downwards. On the other hand, the small virtue invites the grander and most important virtues. There is evolution upwards.

In the monopoly evil private land monopoly comes first. Corporate monopoly follows. The final step would be the nationalization of all monopoly, if we want to carry evolution downwards, and so the monopoly evil to its most fatal ultimatum. There is, then, a certain logic in the socialistic philosophy. It does not accord with moral law, nor with laws of sound progress. It takes effects for causes. It would attempt to suppress the monopoly evil by making it official, public—eternal, so to speak, or rather giving it its maximum destructive force.

The logic of history is as follows: Every step in land concentration marks a decrease in industrial freedom, and a decrease in average per capita production with given tools. Every step in land subdivision marks an increase in industrial freedom, with corresponding increase in average per capita wealth produced, with improved distribution. We are not justified in assuming, and socialism does not prove, that the above logic of history can be changed through the low, human, mechanical contrivance of *officialism*, or *bureaucracy*, a return to old, worn out despotism and complexities.

The correct lines of healthy human progress lies in the direction of plain, simple adaptation to the order of nature. That alone can develop the ideal man, and hence the ideal social group.

Too much government has forever been the great curse of humanity. Too much government means too little freedom. The inevitable officialism of our modern socialists would be industrial despotism under the mask of political freedom, because of

too many laws and regulations with which to keep the individual into a given industrial socket, with hardly any initiative of his own. That would be a reactionary and retrogressive progress with a vengeance.

The socialistic song of large production through combination sounds well enough. But, combination under a strait jacket, without freedom, can never work very well. We have had enough of it to know something on the subject.

Manhood through freedom. Freedom through manhood. Just as few laws as possible. Just as little government as needed to see that Peter does not interfere with John's happiness. And, please, brother reformers, trust men to their own free combinations, co-operations and the like. Don't envelop your reforms in the low materialism of dollars and cents. Dollars and cents shall not be wanting if we strive for that freedom which rests on righteousness, and hence on the *law of equal rights* and opportunities. We have nothing to do with equality in wealth. Why to treat men as if they were a pack of good sized babies?

## THE ETHICAL AND ECONOMIC BASIS OF SOCIALISM.

BY GEORGE C. WARD.

I have been very much interested in reading the very able contributions from my friends, José Gros and Wilfred P. Borland, in the April number of the *MAGAZINE*, and have thought it expedient to contribute my mite to the fund of current discussion of the various phases of socialism.

I am not ashamed to confess that as the days roll by my mind is becoming more and more convinced of the justice and practicability of the single tax and its adaptability as a means to land nationalization, but, strange to say, while single taxers are, as a rule, individualists of the strictest sect, I am inclined to be a single taxer, because I am a socialist and because socialism and the single tax seem to rest upon a common ethical and economic basis. The claims of land nationalization rest upon the postulate that land is the free gift of God to all men and the common heritage of all men *equally*. Accepting this composite ethical and economic proposition as its basic principle, the single tax would take from each and every man, as a tax, any benefit or value derived or realized by him from the use of land, which was in excess of the benefit or value realized by the individual whose benefit or value thus derived was the least of all.

Now, land nationalization is the essence of socialism, as applied to the land question, entailing, as it does, the abolition of private, speculative ownership of land and the elimination of land from the catalogue of com-

modities, or properties which may be ethically bought and sold. Socialism, applied to land, means the common or collective ownership of land, by the people and the restoration to humanity of the heritage stolen from it by a cunningly devised system of land tenure. But the single taxer points out the fact that, while it is true that the land belongs to the Almighty and is simply held by the living people in usufruct, it is so held by them, not only in common, but *equally*, and proposes the single tax as the means of apportionment to each and every individual his or her proper and righteous portion of the land value thus belonging to the whole people, equally, but none the less in common. The single taxer calls attention to the fact that, as land differs greatly in utility, value, and in benefit conferring properties, it is impossible for *free* holding, by use and occupancy, to give to each and all an exactly or even an approximately equal portion of the common fund of land values. Proceeding further in the same line of argument, the single taxer asserts that as the general fund expended for purposes of government and the construction of public improvements is so expended as that the benefits are enjoyed by all equally, if each and every individual is made to pay to the community, in its organized capacity as a government, a tribute or tax equal in amount to the land value or benefit enjoyed by him or her, not only will it be possible to abolish all other forms of national and state taxation, but because of the fact that each and every individual will derive an equal benefit from the expenditure of the public fund thus raised, the people, as individuals will, in fact, own and enjoy the land values of the nation, not only in common, but also equally.

And this, as Mr. Henry George points out, is the very essence of State Socialism as applied to land. And, because I am a socialist, I am about ready to yield an assent to these propositions and advocate the single tax—and further still—because I am a socialist, I propose to use the arguments advanced to sustain the single tax, as potent reasons why the principles of Socialism should be yet further extended, so as to embrace the common yet equal ownership of all patent rights and hence all improved, labor saving machinery and tools of production, all public utilities and specially the banking business or facilities of the nation, through the medium of which the stored up product of the people's toil is gathered up, guaranteed safety and sure return and loaned to those who wish to use it in business enterprises and in the development of the resources of the nation.

The fundamental ethical basis of socialism is the eternal Fatherhood of God and the universal Brotherhood of man. It is found

in the solidarity and homogeneity of the human race and the continuity of its existence. It is found in the momentous yet central truth that society is a social organism, having an organic life and a common soul, individuals being but members of the organic man, the Lord and head of whom is Jesus the Christ. In the beginning of our history of time we find man, and revelation shows to us man, perfected and purified, as the ruler of the universe in the coming new era of redemption. Have there been trials, tribulations, reverses and dark ages? Organic man—the human race—has suffered equally and alike. Have there been triumphs and victories, glories and brilliant achievements? Together the members of the human organism—the *genus homo*—have shared the benefits and reaped the rewards. Have there been gigantic intellects and noble souls? They were but the vehicles through which God worked out His eternal purposes in regard to man. Has man measured the universe, chained the forces of nature and forced the very elements to do his bidding? The authors of these achievements have passed from the stage of action and the glorious results are the common heritage of the children of men. Has invention multiplied the productive power of man a thousand fold? God, who furnished the inspired brain, freely revealed the inventions to lighten the labor of toiling humanity. These are not souls, but one soul, the soul of man. Not hearts, but one heart, the heart of humanity. Not brains, but one brain, the human brain. The thoughts and ideas, the deeds and actions, the glories and achievements, the knowledge of the sciences and advance in art, the fruits of inventive genius, all these belong not to the individual, but to the race, to whom they were bequeathed by the illustrious dead members of the organic body man.

It is a disregard of these vital and fundamental ethics that is responsible for all the misery and anguish, the pain and poverty, the riots and panics that darken with foul blots the pages of history.

The early fathers taught the ethics of socialism as the tenets of Christianity. Said St. Augustine, commenting upon Psalms cxxxii. and cvi.

Let your charity attend to this. It is because of private properties that lawsuits, hatreds, brawls, wars among men, risings, faction feuds, scandals, sins, crimes and man quellings arise. What about? About the very things we hold as private property. Do we ever go to law about the property we hold in common? We draw in the air in common: we all look on the sun in common. Blessed then are they who so prepare a place for the lord, that they do not exult in their private place \* \* \* Then, brethren, let us abstain from the owning of private property (or at least from caring about it, if we cannot get out of owning it), and prepare a place for the Lord. Indeed, that most glorious City of God, when she obtains her promised heritage, wherein none dies and none is born, will not have citizens who rejoice in private property; for God will be all in all. *If any one truly and heartily*

*desires His society in this pilgrimage, he will always prefer things to be held collectively rather than privately, seeking not his own but the things of Jesus Christ.*

And in these latter days many of the most eminent preachers are beginning to voice the Gospel in its ancient and pristine purity. The Rev. Thos. Dixon, Jr., in a recent sermon said:

The only glimpse of light that we see in the darkening picture of our present commercial calamities comes from the spots where social co-operation has taken the place of competition. We find here the key to the ultimate solution. If we are ever to do away with the ever recurring crisis and collapse of trade, we must harmonize the two sides of wealth creation and bring about the era when production shall become social and co-operative, and to this end the organized power of the state, of the municipality and of the district must be brought into concerted and co-operative action. It is inevitable that with the advance of civilization the state shall advance in its functions.

The state is not a tyranny imposed from without. By the state I mean the organic community governing themselves. There are hundreds and thousands of men who are now employed directly by the state. They are not subject to the depressions of a commercial crisis. It is possible for the functions of government to be gradually increased until vast interests now in the hands of private corporations will be placed entirely beyond the danger of panic. It is possible for the municipality to absorb to-day, and that to its enormous advantage great industries that are in private hands.

I appeal for a soul to society. As a social organism we need to be conscious of our being. We are acting as though we were in a dream. We are merely drifting toward these great transformations. Could we but gain consciousness of our organic life we could move forward with gigantic strides. Let no man be frightened with the cry of paternalism. Whether paternalism be good or evil depends entirely upon who the *pater* is. We need a more thoughtful citizenship. We need to study our relations and our obligations to one another. Let the man who believes in individualism take note of his present inconsistent and untenable position.

The present crisis is the wreck of an overdone individualism. The present system, so far from maintaining individuality, is crushing out from the life of men whatever individuality they had.

Is it possible that the followers of Christ, the Socialists, are beginning to apprehend that the message of God to man, the Gospel of peace and good will, is an exposition of the socialistic programme, the reign of brotherly love?

Let single taxers understand that Thomas Jefferson, when he declared that "the land belongs, in usufruct, to the living," might consistently have included much else besides land in his catalogue of the gifts of God held in usufruct by each succeeding generation. Socialism rests upon the same ethical basis as does the single tax.

But what shall we say of the economic basis of Socialism? Single taxers assert that all wealth, i. e. real capital, is the product of labor applied to land. Hence all the so-called capital, with which labor is now exploited, is in reality the proudest of the very labor it now exploits. But United States Circuit Court Judge Caldwell goes farther and concedes that labor is capital. In the course of his decision in the Union Pacific case, he says:

"A corporation is organized capital; organized

labor is organized capital: what it is lawful for one to do it is lawful for the other to do."

But not only is both labor and its product, capital, but what is known as the cash capital, or money invested in business enterprises is actually the property of the men employed by the exploiters called manufacturers. One-half, or probably two-thirds of the total "deposits" in all banking institutions of the nation are the "savings" of the wage workers of the nation. On the other hand, fully as large a proportion of all productive and business enterprises are carried on with borrowed capital, such capital being the savings of the men employed in such enterprises. The banks pay the depositors—say three per cent. and loan their deposits at from six to twelve per cent. The result is that the wage workers pay, as consumers, in increased price of articles consumed, not only the three per cent. the bank ostensibly pays them, but also pay for the privilege of thus being exploited by their own saved capital, the extra per cent. the banks charge for attending to the business. This is individualistic and corporative exploitation of labor for private emolument and enrichment, and the funny part of it is that on top of the interest paid the banks, the exploiters charge interest upon "capital invested?" and a certain rate of profit above wages of superintendency, and yet the employees, in reality, own all the "cash capital" invested, as well as putting in all the "labor capital" expended. And for all this, they get a "bare subsistence."

Now take a glance at another plan. Suppose two hundred men, possessed of the average savings of \$300 each, making a "cash capital" fund of \$60,000. Suppose they invest this \$60,000 in a manufacturing establishment, including lot, building, machinery, tools, raw material, &c., &c. and electing some of their own number as superintendent, bookkeeper, overseer, &c., &c. inaugurate a productive enterprise, manufacture a line of goods and sell at cost to themselves, for home consumption, but to all others at the governing prices in the present competitive market, dividing the net proceeds, above cost, in equal proportions among themselves. In addition to the average wage received under the former system, or example, the two hundred men would receive six per cent. interest upon \$60,000—say four per cent. profits and the money paid by their former exploiters for rent and insurance, and sinking fund, &c. and also the increase in the value of their lot. This would be co-operative, in a competitive community, for the benefit of the individual co-operators, but the consuming public would not be benefited in the slightest degree by the operation. And if this co-operative system were

extended so as to embrace each and every productive enterprise in the country, no one would be benefited except to the extent that the co-operators in each plant, or enterprise were benefited by receiving their own net special product, as wages and for home consumption, at cost and free from the burden of interest and profit.

Nothing can benefit toiling humanity but the abolition and elimination of the factors rent, interest and profit, as now applied and used for individual aggrandizement and the enrichment of capitalistic exploiters of labor. The single tax will divert the rent fund, which now goes to enrich individuals, from private hands to the public revenue. The principles and ethical basis of the single tax, applied in other directions, will abolish all profits above fair wages and utterly destroy interest, thus robbing money of its "power to oppress." I will further elaborate in my next communication.

## HOW THE CHURCHES LOOK ON LABORER'S POSITION.

BY MARIE LOUISE.

The Boston *Congregationalist* dissenting on our perturbed social conditions in one of its latest issues said:

"We think our friends, the wage-earners, have forgotten that the present economic system is not the creation of any single individual or set of individuals but an evolution, or development, the work of centuries, something which capital can no more change than labor, the rich man than the poor man. That churches should recognize this system is only natural."

Personally, I am thankful for the *Congregationalist's* candid statement of its position regarding the claim, or rather the non-claim of the laboring class. It is always beneficial to know the number and the social status of those who step out to affirm or to demonstrate that we, the sons and daughters of toil, have no right to a better place in society than that we now occupy, and that all hopes towards an amelioration are futile. But what is pre-eminently useful in the statement of the clerical organ is the formal declaration that the church recognizes this (our present) system and indorses it as natural and irremediable, being, as it is, "the work of centuries of evolution or development."

Ordinarily, the views of the church on general points do not affect the thinkers and the scientists to a very serious degree, but when the economic question of the day are the matter in dispute clerical utterances acquire a degree of importance corresponding to the hold of the church on the minds of the least enlightened among the laboring class. While the economist and the soci-

ologist, as such, have nothing to say about disputes on religious creeds and theologic interpretation of dogmas, they are morally bound to expose fallacies which the privilege of the pulpit makes dangerous to the solution of the labor problem.

It is marvelous to see how the clergy can, without effort, harmonize gross contradictions and assimilate hostile elements. Only a few years since clerical organs had held it sacrilegious to explain any question by the theory of "evolution or development." The doctrine they upheld was that of *creation, final and immutable, otherwise of fixity*, as interpreted on the authority of the bible. In those days the *Congregationalist* had said "the present economic system is not the creation of any single individual or set of individuals, it is the *creation irrevocable and final of God Almighty, who, in His unerring wisdom, has decreed that there shall be rich and poor, masters and toilers in society.*"

By the law of its being, a church must rest on the divine principle of absolutism; it must represent on earth a power, spiritual or supernatural, whose omnipotence created all things in the far remote past, whose will is unchangeable. The creatures it ministers to must be predestined to pain and hardship on this earth with a beam of hope for a reward beyond the grave. Remove the theory of absolutism, of predetermination, of fatalism, and the church organization at once collapses, its base slips from under it. The idea of a creator omnipotent, absolute and unchangeable, involves the logical inference of the impotency of the matter created to progress and alter its primitive condition; it is an emphatic denial of the qualification of free-will in man.

When the theory of evolution made its appearance in the philosophical world the clergy rose in arms against it and flung at it the bitterest of denunciations. But when the new theory had worked its way into public favor the clerical anathematizers made *volte face* and placed the heresy on their tables of divine laws. This move instantly threw them at the elbows of the agnostics and the atheists, and an odor of fire and brimstone made them recoil a few steps. Their deity, whose very existence the new doctrine threatened, made a somersault and suddenly landed by their side on the new ground they had entered. The deity had donned a new, but ill-fitting attire. Many years shall the garment require to assimilate well to its figure. Yet, clerical veracity swore that no change whatever had taken place in the appearance of the deity, and attributed their late quarrel with the new theory of evolution to the careless use of terminology on the side of their opponents.

To a pure, unprejudiced logician, the theory of evolution and that of creation are

entirely dissimilar. (I mean creation, as understood by theologians and scientists, adverse to the speculations of Charles Darwin and Herbert Spencer, adversaries among whom is found Prof. Dawson, Principal of McGill College, at Montreal, Canada, a scientist of merit, a geologist and explorer of good fame.) The church, however, was not slow in turning the new popular doctrine to its own advantage: it grafted the new theory of evolution on the old one of creation and did it with the best of success. This flank movement saved modern Christianity from destruction for, on the one hand, the church could not afford to do away with the principles of absolutism, of predestination and of innate, persistent depravity; on the other hand, an attitude of obdurate resistance was dangerous, for the people become fascinated with the new idea would soon finally divorce the old. To graft cleanly the new doctrine on the old dogma required a great deal of mental gymnastic, an art in which the clergy has always been proficient. Thus we behold to-day expressions like those of the Boston *Congregationalist*, which, in one and single breath, tell us of an "economic system which is an evolution, or development, the work of centuries," but which has arrived at a point when evolution ceases and "not the capitalist, nor the laborer nor the rich man nor the poor man, (inferring nobody at all) can change it, and that it is only natural for the churches to recognize that system."

Fellow-workingman, do you hear that declaration? The system by which, since twelve months, millions upon millions of working people are out of employment suffer untold privations and pressed by the gnawing of hunger and the shame of wearing tattered clothes, sink into degradation and hold out their hands for alms—a system by which nearly all the land and the wealth it contains has been monopolized into a few hands, thus shutting all natural opportunities against the masses of the people—a system which makes of labor a tool of capitalism to be used when needed and put away when not needed—a system which completely ignores that labor and the laborer are irremediably attached to one another—that system, the churches declare, cannot be changed either by capital or labor, or rich man or poor man—the churches recognize that system as legitimate and moral!

Working people! ye who have ears, hear! Were it not for the influence of the church on the mind of the masses, those clerical and sophistic utterances had not deserved even a passing notice. The clergy has a right to its opinion, but that body of men sways the thoughts of a large number of the community, especially those of women. Persuade

an individual that he is sick and you shall soon have a patient for the physician. Persuade a man that he is born for servitude and he will go of his own accord and place his neck under the yoke. Class privilege is produced by class imbecility, the former can endure only so long as the latter endures.

The statement of the *Congregationalist* concerning the fixity of our present economic system is too absurd to be refuted. It shows in the editor a gross ignorance of historical data, a lack of observation, a want of philosophical knowledge and logical common sense. In society there exists nothing that can not be transformed. Man is not a piece of lifeless matter, or an automaton. He is a being finely organized and endowed with efficient mental qualities. So plastic is his nature that he can adapt himself to his environment and grow out of it with a marvelous facility. All he needs is freedom for his mind and limbs. Let him have that and you will see how long he will remain in the same groove. Every pulsation of a man's heart is for progress, for one step and then another step onward and forward. His activity, expediency and creative genius is inexhaustible, his love for the good and the beautiful is unquenchable. Man is sluggish and stupid when he is in bondage, when his brother man crushes in him the manly dignity and hope, when he is made to believe that he was born to fill the office of a servant, drudge to individuals richer than himself in money and authority, when he has permitted his brother man to use him as tributary and enrich himself with the product of his toil. Labor thus deviated from its normal course by having its product flow off the producer instead of flowing toward him, becomes prostituted and dishonored. Labor and the laborer being welded together, the degradation of the former is reflected upon the latter, and both are thrown into dependency. This monstrous institution, the exploitation of man by man, has, in the course of many centuries, evolved the distressing situation in which society finds itself.

Does it follow, however, that this economic anachronism has succeeded in establishing itself in the public conscience and has become part and parcel of our individual and social organisms? Contemporary history emphatically disproves that assumption. The civilized world is uneasy, it stirs, it groans. Modern society is shaken from center to circumference, the most skeptic admit it. From ocean to ocean the cry is heard: "Investigate, redress wrongs." Even the pope in his mitre elevated on his spiritual throne, feels the universal tremor and sends encyclicals to his flocks on the subject of the commotion brought on by

the clashing relations of capitalists and the laborers.

There is an economic axiom which Adam Smith launched on the thinking world as a bomb whose mission it is to destroy slowly or otherwise, the capitalistic system of industry which the *Congregationalist* affirms cannot be changed. That economic axiom, the most revolutionary of all axioms, is that "Labor is the source of all wealth."

Labor, then, is the intelligent, designing, purporting creator of wealth. Capital is a part of the produced wealth transformed into an implement needed to labor for the furtherance and the increase of production. Thus it becomes one with labor, and both factions logically belong to the laborer. The subjection of labor to capital is an anomaly, a departure from the laws of social equilibrium, a subversion of the natural order of things. The term labor suggests the action of an intelligent being. It cannot be bought or sold unless the creature who labors is also bought or sold with it. The subjection of labor means nothing short of servitude for the laborer. In other words, a condition of slavery which by its very nature is the subversion of all social equity and of all sociological laws. The present situation of labor being anomalous, agitations and disturbances are inevitably produced, a general sense of insecurity and fear prevails in society. Demands for more repressive laws besiege the legislature, while the increase of repression ever bearing on the poor classes, fomented hatred and incites evil deeds.

The question at the bottom of all social trouble is the placing of labor in its normal position. Man must live; to live he must work and the product of his labor is all his own. Capitalism is a cancer on the body economic; with care and circumspection the tumor shall be removed and health be restored to the body. The abolition of capitalism does not imply the ruin of the rich and the enrichment of the poor; it means wealth for all and labor for all, it means peace and plenty, it means that each individual shall be self-supporting and free. Labor and capital, by the force of logic, are one. Pierre Joseph Proudhon, says: "Labor, talent and capital are analytical terms, not synthetic. Capital is labor solidified, talent is labor considered in its several degrees of perfection."—*De la Creation, de l'Ordre dans l'Humanity*, page 256.

It is obvious, therefore, that the artificial line drawn between the economic factors, labor and capital, is responsible for the social misery we endure. The evil, as it strikes the working class, does not spare the wealthy; a social commotion is felt by all. The "Labor Problem," as it is called, is easy to solve on a purely natural basis. What stands in the way is the short sight-

edness of the rich and the lack of clear judgment in the poor. Wealth blinds and hardens the former, poverty misleads and confuses the latter. Yet let both the rich and the poor beware; a problem brought forth by the logic of events for a solution *must* be solved, and the sooner the better.

### FREE USE OF THE EARTH.

BY W. E. BROKAW

In your May number W. H. Stuart makes a lop-sided argument against the single tax and then says: "My single tax opponents never answer this argument." What is his argument? Simply that farmers cannot now compete with capitalists and have abandoned farms in sight of factories, and that "all the advantages to be derived from improved tools, machinery or other capital would go, as now, to the capitalists." This latter is an unsupported assertion which he cannot prove. The reason why not only farmers but other laborers can not make a living on those abandoned farms, and barely exist anywhere, is because everything they consume or produce is taxed—their industry is fined, while the speculator in land is almost exempt.

The value of land is purely the value of the privilege of exclusive possession. The privilege to exclude others is all that ground-rent is paid for. Where that privilege does not exist land has no value. The degree of that value is determined by the advantages such privilege gives. The more people desiring that privilege over any locality, the greater advantage, and hence the more valuable it becomes. I defy Mr. Stuart, or anyone else, to show any other way of securing both equal freedom in the use of the earth, and exclusive possession of certain portions of it, than by requiring each exclusive possessor to pay to the whole excluded community the full annual value of that privilege.

I also defy him, or anyone else, to show how, with such a land tenure system in America, capitalists or any other class could dictate wages or keep men out of employment who desired work.

Property rights all spring from the individual's right to himself—self ownership. He who does not own himself cannot own anything. Self ownership is manifested in control of one's own faculties and the results of their exertion. Without equal freedom in the use of the earth one cannot be equally free to exert his faculties and control the results. If not equally free he is partially a slave—and that's how it comes that another becomes possessor of the fruits of his toil. There is no other way. The single tax will secure that equal freedom in the use of the earth, and nothing else will. The veriest savages, under

such freedom, could soon amass great wealth, independently of all "capitalists" producing their own capital. But without labor the capitalists would starve in a short time.

Whether Mr. Stuart has ever been answered through your columns or not I do not know. But he has been answered from the platform in his own city of Los Angeles, where he wilfully or ignorantly misrepresented utterances of Henry George, and failed to come forward manfully and admit it after being corrected. Such men may deceive the uninitiated by their bombastic claims, but they cannot convince the cool reasoner who will take the pains to study the single tax. To one who has been as many years in the agitation as I have, meeting leaders of thought of all schools, it becomes exceedingly monotonous to read such stale objections, continually rebashed, as Mr. Stuart advances.

One thing more, concerning your editorial on the labor problem. You say: "We urge the wage method of solving the labor problem because it alone can solve it," and then add: "Why clamor for single tax?" I answer, because nothing else will secure to each his full wages. Because, no matter what other reforms you adopt, or solution you try, the benefit, if any, goes to "the robber that takes all that is left." See "Protection or Free Trade," chap. XXV.; and the single tax is the only thing that will kill off that robber.

### INTEREST.

BY D. C. DAVID.

In the April number of the MAGAZINE I noticed an article on "Money and Interest," by my friend, Mr. James Middleton. This interest question seems to be a hobby of his. He uses the old illustration: "I am a farmer. I need seed corn, potatoes and wheat; I have not the money to buy with; my neighbor has." Why haven't you the money to buy with? Is it because you have neglected your opportunities, or because you have not had opportunities? The chances are as a million to one that you have had no opportunities. I have the things you want, but I know we are not going to meet as equals. We meet as master and slave; the fact that you are under the necessity of borrowing makes you a slave. But as you talk like a fairminded man, and are willing to pay for service rendered, I will lend you what you need; and will tell you something you do not seem to know. If you take care of the corn, wheat and potatoes that I don't need, and return them to me when I do need them, you will render me as great a service as I render you. Why should you return me an increased

quantity, when, if I do not lend to you or some one else the quantity will be *reduced* in the fall? Of course, any increase must come from labor and the *reproductive forces of nature*; but I will charge nothing for the reproductive forces of nature, nor for the use of the earth. Why should I? Oh, no, I charge nothing for risk, because I am not going to take any risk! If you know of any man who will lend without security, I will be greatly obliged if you will point him out. You take the risk of losing your home and you furnish me with a basis of credit, therefore, why should you pay me interest? I understand, perfectly, that although I cannot save my wheat, etc., without loss, I can sell it and save the money, thereby forcing the loss upon somebody else. Because, if I save \$100, commodities to that value must perish, or remain in the reservoirs of nature, for want of an effective demand to call them forth. Whether I destroy what has been produced or act in such a manner as to prevent its production, amounts to the same thing. I have a little scheme to get and save \$100, but others have similar intentions, and therefore *save* their money so that the \$100 never gets to

me. I can prove, in many different ways, that interest is robbery.

I will not take up space with an explanation of the genesis of interest; because its origin can easily be found in the desire of men to get something for nothing. This desire is no more pronounced in those who have millions than in those who have nothing. If brother Middleton should come my way without a coat, and I should have an extra coat, I think I ought to give it to him. Because, if I were the only denizen of the earth, I would have no coat. Others must, therefore, have contributed to the making of that coat, and many men, possibly, have a better claim upon it than I have. The fact of my having two coats, while thousands are coatless, is a suspicious circumstance in itself. If I should commence to act in a brotherly fashion towards all men I might create an impulse that should go on increasing in energy through all the unthinkable cycles of eternity. I cannot say that I have always, nor generally, acted that way. I have studied Theosophy, and have a better fulcrum for my lever than I once had. I recommend theosophy to readers of the MAGAZINE.

#### SAM DELANEY'S REDEMPTION.

Shabby Sammy Delaney stepped up to the bar, And from toeing that mark he had many a scar. He was bleary-eyed, and red nosed, had wrinkles so deep, That a fly crawling round to cross o'er them should leap. There he stood, full of longing, no money had he, And the bottles so tempting before him could see; He was nervous, unsteady, down-hearted and weak, But he managed these words there to shamefully speak:

"I am sick and in need of a drink to restore My poor head, for it aches as it ne'er did before; All my nerves are unstrung, and my heart is a load, Bearing down like a stone in its fleshy abode; And my stomach is empty, my spleen that are past Are as nothing compared to my greatest and last; Will you give me a drink to recover my brain? And, with God's glorious help, ever more I'll refrain."

Then the bartender said: "Yes, I'll give you a drink, But in mercy's name, Sam, of your family think: You've a wife whom you've sworn at the altar to love, And two children, akin to the angels above; If you longer pursue such a dissolute course, Separation must follow by death or divorce. Here's the bottle, but pause ere you touch it again, Though I sell it, I prize the redemption of men."

Sammy thought for some seconds, but touched not the glass: He reflected when Kate was a beautiful lass, As they strolled side by side, 'neath the shade of the trees, When her ringlets were tossed by each spice-laden breeze;

Of the vine-trellised cot where they lived when they wed, And the hopes they enjoyed, now long faded and dead;

Of the eyes that were dim from the fall of her tears, And the miserable life he had led her for years.

Then his heart that was seared by intemperate hours, Soon began to o'erflow, till the tears fell in showers. For an instant or two he let nature have sway, Then he straightened himself, and he brushed them away,

And he said: "There are times in the lives of us all When a word can reclaim us or urge us to fall.

You have saved me, old friend of my youth, and I'll prove I am worthy my wife and my children's love."

Out he went; not a taste did he take, but began, Once he passed through the door, to again be a man. He fought bravely the battle the craving to kill Which he had for all liquors. At length his strong will

Made him victor at last. Now he has his reward— Once again is his mansion with merriment stored, The glad face of his wife and the pranks of his boys, As he shares in their sports, are the best of his joys.

If we'd stretch forth a hand and a kind word in time, In the manner the bartender done in the rhyme, We perhaps might reclaim many victims of drink, Ere too deep in the dregs of damnation they'd sink. Human nature is weak, there are none of us strong; Though our aims may be right, we too often go wrong. Let us aid one another, much suffering 'twill save, And perhaps we'll have peace t'other side of the grave.

Shandy Maguire.

### WHAT CONSTITUTES "ECONOMY" WHEN THE COMPOUND IS COMPARED WITH SINGLE CYLINDER?

Possibly other readers of the MAGAZINE have waded through some statements as to the work of a new compound, in which a large percentage of gain was said to have been accomplished; but it is not usual to have such a statement without one single figure for comparison. In reading over the several statements it struck me by its inconsistency, and in the total lack of any sort of defined information. It is usually the practice to say that a certain number of pounds, or some sort of reference was the fact, and in the report to the superintendent of one of our railroads, he would in all probability ask some pointed questions if an engineer was to report he had taken on "the usual amount of coal from station 14," it is quite likely that engineer would get a short but clear inquiry to step up to the captain's office at once. But in this statement we are told "the performance was very satisfactory," and the run over the same line with the same number of cars was with a perceptible saving of fuel (?). How do we know, there is no weight given, no time, no miles, nothing but the bare statement that it was so, and then as we read further on we find, "steam at the end of the stroke was apparently very dry." How do we know? Was it in any way tested? What does the indicator diagram look like? What is the efficiency as compared with the theoretical? Or is it similar to some statements made a short time ago, with reference to an electric lighting station run by a professor in a university, who claimed that he could run his power for three pounds of fuel per indicated horse power an hour. A test was instituted to ascertain how much he did know about it, and the report said at its final figures, that "under favorable circumstances he did produce a h. p. with 5.843 pounds per hour, but taking the full night's run and for several days in a month, it was found to be over *six* pounds an hour, or 6.23+." Here we have a statement that, while we do not doubt his honesty, was only within fifty per cent. of the truth, but it was troublesome to find out what was the fact.

It is far easier to say, than to get at facts first and then state them, and the very lack of this reliable information is a prejudice to all parties. What we desire is such information as will make our statements respected, and based on facts alone. But

to return to our savor of fuel, the statement is all in favor of the new engine as compared with one of the old plan, single cylinders, but there is not one figure in the statement, nor is there a basis of any comparison whatever for the reader to work out to his own satisfaction where the saving came in, or how it saved in amount or percentage; and unlike a statement lately made by an engine builder, as to his new arrangement of cylinders, for when his machine was at work, and the exact test he had so stipulated was carefully made, it was found he had agreed to do a thing which was and is utterly impossible with any steam, unless with superheating to some extent, and no way was provided to do that, and in the end of the computations it was found he had promised to do between one and three-quarters and one and eight-tenths as much as it was possible to do with the steam, and he is now looking over his plans to see how it was; really, he had agreed to work on the abstraction of heat from steam in such a way that it called for 23 per cent. of the heat in steam, while it is a most excellent one that gives out 14 per cent. of the total. The man was wrong, or his way of expressing it. Here we have a very troublesome factor, the heat of steam is not to be mixed up in such calculations, for as a physical substance it has the same utter disregard for the statements of careless men, as they have for the laws that so far as we know, govern its going out and its coming in. In its "cycles," where operated for power, and in all these workings we are to study what is possible with all regard for the truth, rather than to do so with any idea of adapting our preferences to the action of heat, we might be more successful.

That there are gains in the use of multiple cylinders is not to be disputed, but it is as necessary to say that those cylinders are to be used with some regard for the conditions under which fairly favorable to their load is to be observed. And in all such cases it is to be understood that where the conditions change much as to the load there will be found less economy than where the conditions are carefully regarded; but if the vacuum could be added to the locomotive it would be far easier to make a great gain, as it is we must let the problem be worked out with a trial running over the course of a few years, and out of reach of the patentees or interested parties as the only way of settling its actual worth to its users.

An inquirer wants to know what is the weight of a gallon of water at its greatest density, also a cubic foot of same?

Water is at its greatest density at 39.1° F. and a cubic foot weighs 62.425 pounds

avoirdupois, and the United States standard gallon of 231 cubic inches, at 39.1° F., weighs 8.3451 pounds, and in one pound at the same temperature there are 27.6812 cubic inches. The formulae for computing the density of water was given in the FIREMEN'S MAGAZINE some two years ago, not having them at hand cannot give the reference.

\* \* \*

A regular reader of the MAGAZINE has written for some information as to the use of petroleum for fuel. He asks, "why is it that if petroleum has twice or more the heat in it that coal has, it is not more used for making steam?" To answer this requires a little explanation. Anthracite coal has in it from 12,300 British thermal units per pound, to as high as 14,500 or more. Bituminous coal has less or more, all dependent on the sort of coal and the amount of moisture, as well as ash or foreign matter in a pound. It is as a rule in practice considered to be equal to the evaporation of twelve pounds of water into steam if all the heat units are utilized, or that that is the limit of practice in the use of coal, from present information, and the cost of coal is now near \$3.25 per ton for steam.

Petroleum has the heating capacity of from 21,000 to 21,600 heat units per pound, or pretty nearly 50 per cent. more than coal per pound, and it is also true that it has not so great loss in weight as has coal, so that its real efficiency is rather more than 50 per cent. above the value of coal per pound, or equally to nearly 1.8 pounds of coal in its heating capacity when all considerations are allowed.

The weight of a gallon of petroleum is 6.5 pounds standard, but nearer 6.7 when weighed, so that a gallon of petroleum is equal to nearly twelve pounds of coal under the boiler in its heat power, and it requires 190 gallons to equal a ton of coal (gross), or 2,240 pounds.

The price of oil in Boston is slightly under three cents per gallon, or  $190 \times .03 = \$5.70$ , cost of oil equal to a ton of coal at \$3.25 or nearly that, so that although oil has in it fully 50 per cent. more heat units per pound, at the present low cost it is far higher than coal, and if the Standard Oil Co. should at any moment say it was ten cents a gallon, no one could say no, if it were not out of the question at cost, and it is also curious to find that when boilers have been fired with oil for a while that the shell or tubes are structurally changed, for the fire is so fierce on the sheets or surface, that defects are fast brought to the surface, and in some cases the use of oil has been found to make the iron or steel short, and soon come down, but what the specific cause of this is, is not known, it is as likely to be some

treatment of the rolling or in working as in the oil.

A mixture of oil and steam has been used and shows very little superiority to that of coal when all is considered, but it is very dangerous in some of its applications, for the heat is far more intense than oil alone. Many kinds of fuel have been used to supplant coal, but in a careful consideration there are none of them as good all considered.

Mixtures of good coal with screenings, or with culm, are much used, and are advantageous in cost where there is grate surface enough, but there is little use in expecting to compete with coal in the locomotive, for it usually draws its own fuel from the mine to point of consumption, and it is likely to remain so, regardless of the claims of competitors.

Some of the fuels used are curious in comparison. In some of the horse rail roads, or where cable and horse were to some extent combined, the dung from the horses is fired regularly and with good results. In cities it is used to save cartage. This is used combined with saw dust, and it is peculiar in its action on boilers, shortening the life or durability of the boiler in a very perceptible manner.

Saw dust and water form another fuel in use at the large saw mills. This is mixed with shippings, or edgings and fed green, it not wet. The spent tan bark is used in tanneries, and is wet or partially dry from the press. This is very efficient when it is dry, but as used it is of small value alone, but when mixed with soft coal or culm is much used, and it is cheaper to shovel it into the fire than to cart away if wet. When dry it is nearly 90 per cent. value in the fire pit, when wet or moist it varies from 15 to 25 per cent.

In southern states and the islands the remnants of the sugar cane, called "bagasse," is used in the fire pit, when dried it is most excellent fuel.

Cotton seed was used until it was found the seed was almost equal in value to the lint, and the hulls are now burned, and the pomace after the oil has been stripped by the press, but there is little of it done now, for the meal made from the pomace is again almost the value of the seed as of old; for years this was thrown away, it is now an important factor and is money.

There is yet much to learn of the value of fuels in relation to making steam, and it is not possible to make any great strides in it, but the small advantages are to be studied and in all of them there are many to save something on, or in connection with. Boiler and engine are not either perfect, and can be improved, plenty of room for us all "up stairs." Can we reach it?

Thos. Pray, Jr.

### RUNNING BY LANDMARKS.

*Locomotive Engineering* recently contained some comments on a theory that some person had advanced, that engineers should cultivate the practice of counting the rail joints for the purpose of determining their location in snowy or foggy weather when it is impossible to keep track of familiar landmarks. The stand was taken, and justly so, that the person who advanced any such theory as that had no practical knowledge of locomotive running, as an engineer has so many other necessary duties to occupy his attention that it is an utter impossibility for him to occupy himself with counting rail joints. Most roads now have mile posts situated close to the track, which can be seen except in extraordinarily bad weather, thus enabling a man to tell where he is; but it was not always so, and it is not universally so now, and it is not infrequent, even now, for engineers to become utterly bewildered and lose all track of where they are. It is not, by any manner of means, a pleasant situation for a man to be in; and I can think of nothing more calculated to give an engineer the "creeps" along his spinal column than the certain knowledge that he is running along without knowing exactly where he is, unless it may be the sudden discovery that he don't know where he is when he has all the time been running along in the confident belief that he did know. That latter discovery sometimes comes to a man as a result of running by landmarks without knowing it, and, while watching out for his landmark, he suddenly finds that he has the old girl wide open and making time in a place where he ought to have her shut off and pretty well along towards a full stop. When that discovery comes to a man all of a sudden, if it don't raise him right up off of his seat and shove some of his hair up through the roof of his hat I don't know what will. I have been dead lost many times when I knew I was lost, and the man who would have talked rail joints to me at those times would certainly have stood in danger of a terrible death, but I was never lost without knowing it except once, and that once scared me so bad that I would want big pay to go through the same racket again, although I was in no real danger at all. It was a number of years ago; I was firing for one of those engineers who can always tell when the fire-boy begins to get weary, and who is not afraid to take hold of the scoop and help him out. We had a hard run, a night freight, the time was fast and the train was heavy; and together with doing work along the road and getting laid out here and there for superior class trains, it was almost impossible to pound the old girl hard enough to make the time on the first sixty miles of the run, which was almost a dead pull for

the whole distance, with the exception of a few miles where a man could swing them a little. But the last thirty miles of the run we had things all our own way, nothing to meet, no work to do, and track that was just enough down grade all the way so as to make it an ideal place to make up time. We used to figure to make up about all the time we could in running this thirty miles, and it was customary—a custom which he established himself—for my engineer to take the scoop whenever we arrived at that stage of our journey, as we used to double the road on this run with practically no rest, and by the time we got back to this point I was generally pretty tired and in good shape to take a little rest. Well, on the night I got my scare we had made a pretty good run, and when I took the throttle I figured on striking the end of the division on time without any particular effort. Everything run along as I had expected and we passed the last station, six miles out from the end of the division, only about three or four minutes late. Right here we ran into a dense fog that had settled down over the face of the country; but that was not an uncommon occurrence and it caused me no uneasiness, because I knew the road so well that the idea of getting lost never entered my head. Just before entering the yard we had to make a stop for a railroad crossing, and we used to shut off for this stop, generally, at a big barn situated close to a double road crossing, about half a mile back. This always made a good easy stop for us; with a good rail it was only necessary to set three or four brakes on the hind end and the thing was done in good shape. There was three road crossings between the last station and my barn and on this night I located them all without much trouble: I had them sailing along at a pretty good gait, expecting to see my barn loom up out of the fog at any instant and thinking how good it would feel to wash up and crawl in to bed after striking town exactly on time, when, horrors!! a switch light loomed up out of the fog, and clinkety clink the old girl went over a switch about a quarter of a mile from where I ought to have them to a dead stop. Well, maybe my heart didn't come up far enough to shut off my wind. I was so scared for a full minute that I could not see straight; but instinct helped me out. It was only about the fourteenth part of a second after I struck that switch until I had the caboose jacked up and the old girl working on sand in the back motion. I expected sure to run that crossing, and there was some danger in doing it, too, as there was a train due there on the other road just about that time, but I never knew the old girl to act better than she did that night; she seemed to take right hold of them from the start, and although I don't believe the train

crew had time to set brakes enough to do any real good, we came to a stop within about fifty feet of the crossing. I was over my scare by that time, enough to begin to look around me, and I cast my eyes over to the left hand side and found that engineer of mine sitting up there laughing at me. He made me mad by telling me that when I put her over, with the coal dust on my face, I put him in mind of a whitewashed nigger. It didn't take me long to recover my spirits after that. I haven't had any more scares like that since, nor I don't want any. The conductor came over ahead with the bills just as we were pulling into the yards, and the remark he made almost gave me the heart disease. He said: "that was a mighty good stop we (that we is what fixed me) made at the target." I could only answer, "yes, that's the way it looked to me."

But, talking about landmarks puts me in mind of something else. I know somebody will say this is a lie, because there have been stories similar to this one going the rounds of the press for a number of years, only varied some as to location and circumstances, but I can take my oath on a stack of Bibles of any size that this is a Gospel fact. I was running a locomotive on a logging railroad up in northern Michigan; there were ten crews of us who used to run five engines, working night and day week and week about, changing from the day to the night run, and vice versa, every Sunday. We hauled fifteen cars in each train, and made four trips from the skidways to the banking ground and return for a day's work. The road was operated by a telephone system, a box being placed at every side track, where the engineer of each train used to apply for orders from the train dispatcher at the central office as he needed them. There was nothing very arbitrary about this system of running trains, and the way some of us used to interpret our orders would have turned the best train dispatcher in Christendom into a raving lunatic in attempting to tell where all of his trains were at any given time, and, "thereby hangs the tale." It was to our advantage to get our four trips in as quick as possible, as that finished our day's work and we could then turn the engine over to the other crew and take a rest, and we used to take advantage of every circumstance that would put us ahead. When we got our load at the skidways we would get orders to meet one or two of the empty trains at sidetracks down the road, they having similar orders with respect to us. Well, we would jog them along as fast as possible and if our empty train was in the siding at the established meeting point, all right, we kept right on going; and if she wasn't there why it was all right, too, we kept right on going just the same. This was calculated to mix

things up; we generally met the empty trains between two sidetracks, keeping our whistles in operation so as to let them know we were coming, and then they were compelled to run ahead to the next sidetrack and let us by, and as we made time, or thought we did, by this practice it came to be the established rule with us, accepted by all without protest, except the kicker, "Big Pete." For the life of me I can't tell what Pete's other name was; I never heard anybody call him anything besides "Pete," or "Big Pete," and he was big, so big that he almost filled up the cab, and you never met him but he had a kick coming about something or other. He had formerly been a passenger engineer on some road running out of Chicago, the Northwestern, I think it was, but whiskey had got the best of him, and whenever he didn't have three or four drinks inside of his skin he saw things crossways and became grouty. Well, "Pete" didn't approve of our system of running trains, he said it was dangerous and liable to put some of us in a condition to get measured for a wooden overcoat if we did not stop it. He went to the dispatcher about it, but the dispatcher told him that he could do nothing about it and referred him to the superintendent. The superintendent was a person who knew a whole lot about sawlogs but not much about railroads, and he could see no particular danger in the way the trains were run, so he told "Pete" that as long as the boys made the trips all right he could not see as there was any particular danger in the system. He said "all you have to do is to watch out the same as the rest of them;" after that, "Pete" had to content himself with growling. One night, it was dark as pitch, I got orders to meet "Pete" at a certain side track down the road, and when I arrived there he was not yet in sight, but this time I lived up to my orders. I had a couple of pistons which were blowing pretty bad and I had got a few turns of packing fixed up all ready to slip in at the first opportunity, during the few minutes I had waited for my train to be loaded, and I made up my mind to wait for "Pete" this time and slip in a few turns of packing while doing so. I hurried up, all the time expecting "Pete" to show up around a little curve about a mile from the siding, and got one piston packed. Then I listened for "Pete" for a moment but could hear nothing of him. I slipped in one turn in the other piston so as to stop the worst of the blow, then I went to the telephone box and asked the dispatcher what he knew about "Pete." He said: "damfino anything about him, he pulled out of here like he didn't have no time to lose after I give 'im 'is orders, and he's had plenty time to git there fore this." I made up my mind that "Pete" was in the ditch somewhere,

and I concluded to pull out. I started, and had just got my train about half way by the switch, when I heard "Pete" whistle away down the road. I stopped and backed up to clear the switch, and in another minute "Pete" came rolling around the curve and was soon in the siding out of the way; when he pulled by he saluted me with, "whatin-helkepye." I met "Pete" the next day and asked what had been the matter with him the night before when coming back after making his second trip. He said, "Hub, there was nothin' the matter with me, but there must have been something wrong with you when you was so dam particular about living up to your orders as to wait a half an hour at a meeting point for an empty train." "Pete" had asked the brakeman on my train how long we had waited for him the night before on that trip. Well, that's all the satisfaction I could get out of "Pete," but the thing was too good to keep and his fireman gave it away a few days after that. Between the two sidings, the one at which we had orders to meet each other and the next one down the road, there was a stretch of perfectly straight and level track about three miles long; at each end of this straight track there was a slight curve and the siding where we met was about a mile from the straight track after turning the curve at the upper end, while the other siding was less than a half a mile from the curve at the lower end. When "Pete" turned the curve at the lower end of this straight track on the night in question, between the dense rows of tall pine trees that lined each side of the track, he saw what he took to be my headlight just turning the curve away off at the upper end of the straight track. "Pete" shut off with his usual remark, "somebody's goin' to get hurt yet with this dam fool way of running trains," and backed up into the siding which he had just passed. He waited a reasonable length of time for me to show up and thought it strange that he heard neither my whistle nor any sound from my train; he began to get suspicious that there was something wrong and told the brakeman to pull the pin and he'd take a run up to the curve with the engine and see what was the matter. When he turned the curve the second time there, in the same old place, was my headlight; but this time he made it out to be the full moon which had just risen, and he couldn't mistake it for a headlight any longer for it was now half way up to the tree tops. He got his train out of that side track pretty lively after that, and before morning he had sworn both the fireman and the brakeman to secrecy but they failed to keep their oaths. It was only necessary to say "moon" to "Pete" after that to throw him into a spasm.

W. P. Borland.

#### LESSONS FROM OUR WRECKS.

Some months ago I took occasion to call attention to the fact that the officers and men of the M. & E. division of the D. L. & W. R. R. could with truth be proud of their record, for in spite of the fact that it is one of the oldest roads in the United States, and has for years done a heavy passenger, freight and coal business, no passenger had ever been killed in its cars. But the article had hardly appeared and reached its readers when the sad accident on the Newark Meadows, on January 15, marred the hitherto fair record of the road.

It appears that during a dense fog (which is apt to hang over these meadows on winter and spring mornings) a passenger train, making its way to New York city with its daily load of commuters, was overtaken and run into from the rear by another train, also loaded with its daily patrons, and as a consequent result thirteen lives (all passengers) were sacrificed, besides some forty more or less severely injured, some crippled for life.

The road has been severely censured for not having a block signal, and it has been asserted that with block signals such accidents could not happen, and yet it is a fact that on another road, running over these same meadows, had a disastrous collision at a point not more than a half mile from the scene of the M. & E. road wreck, and this in spite of the fact that said road was equipped with a block signal. It seems strange that so little was said or heard about this other accident, although about the same number of lives were lost; but it may make some difference because they were "only immigrants," and the road used to be considered as owning the state of New Jersey. I think that fair play and no favors should be accorded to all, and if the M. & E. has established a good record, do not too hastily condemn them for one error or mistake, but give the officers a chance to show that they consider the safety and comfort of their passengers as paramount to all other considerations.

The precaution for rear-end collision in use on the M. & E. is the standing order for the rear brakeman to flag trains following his train, and to also place torpedoes on the track to warn the next train that the previous train has been stopped. The first part of this order is all right, for if one train from any cause is failing to make its time, and is thus running near the time of a following train, the flagman should drop off and flag the other train, and if this rule had been adhered to the accident would not have happened. Again, also, that slaughter of immigrants on the other road would not have happened if the block signal system had been properly managed and obeyed. This brings us back to the fallibility of the

human race—frail man, with his weaknesses, his foibles, his mistakes and his short comings.

Sometimes, when hard pressed and over worked, man asks: "What do the dispatchers take me for? Do they think I am made of iron or steel and will not tire?" This seems to imply that iron or steel mechanism would be better to rely on than fallible man, and no doubt this is true.

We have automatic machinery that performs its allotted task without failure, and even goes so far as to keep tally on itself, and present at the close of it day's work a record of its performance. There are those machines that turn out our envelopes about as fast as one can wink, then counts them into bundles of twenty-five and present them to the operator ready to pack away.

Water works have automatic registers giving the strokes of the pump and number of gallons pumped. Automatic meters measure the water or the gas consumed in a certain line of pipes, and all do it with unflinching accuracy, because they are iron or steel and do not get tired or fail.

Before going further, I wish to allude to the torpedoes which the flagman is to place on the track whenever he goes out to flag. The orders are that he is to go back about one-half mile and place a torpedo on each rail, then, when he is called in, he is to put another torpedo about half way to the train. Now, the orders to an engineer striking torpedoes are to bring "his train to a full stop" and "then to proceed with caution until the cause of the torpedoes is ascertained. Accordingly, a train striking torpedoes must be brought to a full stop, and if the flagman does his duty he will go back one-half mile and put on his torpedoes for the next train, and so on *ad infinitum*. I have had the luck to strike seventeen torpedoes in seven miles, and saw nothing of the flagman that placed them or the train that he belonged to. Suppose I had made those seventeen full stops, given my flagman time to travel one-half mile back and return to my train, and that each succeeding train lived up to the same rule, what would be the result? There would be a block of trains at that point trying to get over the road but not able to do it.

Torpedoes tell you that at some time some train has been stopped or ran slow at the point where you crack them, but whether it was five minutes or five hours since they were placed you have no means of telling. I have cracked some late on Sunday afternoon which could only have been placed by trains about 6 o'clock Sunday morning, and which, to my knowledge, had reached their terminus before 7:30 that morning, yet at 6 o'clock Sunday evening they warned (?) me of danger ahead! Under these circum-

stances what good are torpedoes? They tell you nothing definite.

While running an extra, or as some call it, a second section of a train, it was my fortune to follow a flagman who used to place torpedoes with great liberality. I tried to persuade him to adopt some sort of a system about it, for our mutual benefit. For instance, I said to him: "If you are on time do not put on any torpedoes, because I do not expect to run on your time, or if I come to a water tank near your time I shall be looking for you." "But if you are stopped and behind put on one torpedo for five minutes, two torpedoes for ten, and so on, one torpedo for every five minutes you are behind time, and then when I come along I can tell just how long you have been away." "This would be some satisfaction to me and ought to be to you, because you would know that you had given me some information." But after these talks he would go on his old way the same as before, and I could never find out where they were or how long they had been gone ahead of me.

The best satisfaction to an engineer is some definite idea of the location of the preceding train, and an invention got up by two conductors on our road, Messrs. Young and Davis, meets the requirement better than any block signal, and does it automatically; never failing so as to produce danger; if it ever should fail it would be on the side of safety.

In simple language, the system devised by these gentlemen consists of a series of clockworks, set up at suitable points along the road, and designed to run at regular time speed, and carry a suitable hand over a dial, numbered up to forty-five minutes. These hands are operated either mechanically or electrically, so that a dial can show for the spot opposite the post or by wire connection with a spot in the road a mile or more away.

In practice, a train passing a post with the clockwork wound up and running, depresses a small lever which breaks a magnetic circuit by which the hand is carried over the dial, and the hand is brought up perpendicular. As soon as the train has passed the hand commences to move from the perpendicular, and keeps indicating the lapsed time. When the hand stands horizontal to the right it will indicate that fifteen minutes have lapsed since the train passed. If the hand points down it will indicate a lapse of thirty minutes, and of course, when it reaches the other horizontal position, it would indicate forty-five minutes lapsed. As before stated, the post can be connected with the tripping arrangement by wire, and could thus send back its message to the following train that the preceding train had reached and passed a

point a mile or more away so long ago.

In actual practice we will assume a post set at the side of a piece of straight track, and connected to the rail at that point. An engineer sees the hand at fifteen minutes and knows that the preceding train has been gone that long. He next finds another post along the straight piece and finds it at ten minutes. This would show that the other train was not making its time, and would cause him to watch for the next indicator. Now suppose at the end of the straight piece we have a deep cut and a sharp curve, and that a point beyond the cut and curve was electrically connected to a post near the end of the straight line, and that its pointer also showed ten minutes. The engineer having definite news of the train ahead, need feel under no apprehension of finding a rear end, and being obliged to use the emergency stop.

If the clock should stop, or the magnet or electricity fail to work, the hand would remain at twelve, or perpendicular, and indicate danger, and the engineer would proceed with caution to the next post, and as it is not presumed that they would all fail at once, he would get the proper information there and proceed accordingly.

Having carefully studied the patent papers of this invention, it seems to me as if it were far ahead of anything yet out in the way of a block signal, as it is entirely automatic in its action, and gives definite information about lapsed time, which no block system has ever attempted to give.

Wm. Weiler.

#### No Communication Between Train Pipe and Gauge.

MR. EDITOR:—I wish to inform Andrew Reid that there is no communication between the air gauge and train pipe when the engineer's valve is on lap. When you pump up the maximum pressure, and lap the valve, and open train cock on back end of tender, your black hand will fall owing to a leak in the rotary valve, due to its routine motion, and not from train pipe. It can also be proven by opening the train pipe cock at front end of engine. Now we will try it with a train. Take a train, say of 20 cars, and make a reduction by service application of ten pounds then bring valve back on to lap, and see if black pointer does not remain stationary, though the train pipe pressure is escaping from train pipe below piston 17. My object in presenting it to the MAGAZINE was to bring out all possible argument, as nothing creates more interest like a spirited argument, especially on that important subject of the "Air Brake" where it is settled beyond a doubt that it will be an important feature in the examination of firemen for promotion. Another point in the handling of the air brake,

is why does a service application hold better sometimes than an emergency. This is caused by the check valves in the triple valves leaking. When you make an emergency application, the train pipe pressure enters the brake cylinder through the check valve, uniting with the reservoir pressure, giving a pressure of 60 lbs. per square inch on the piston, and as soon as the pressure becomes equalized, the check seating prevents brake cylinder pressure re entering train pipe. But as these check valves often leak, the cylinder pressure feeds back to train pipe through the leaky check, which of course releases the brake. To test this point make an emergency application, leaving the handle of valve in the emergency position, and walk back and notice what cars have their pistons in release position, or releasing slowly. And those that are releasing can be counted upon as having a leaky check valve.

BALTIMORE, MD. *Walter C. Garaghty.*

#### A New Definition of Clearance.

MR. EDITOR:—I wish to take Mr. Garaghty to task in regard to some of his answers to the examination chart questions recently propounded by *Locomotive Engineering*. Some of Mr. Garaghty's answers are excellent, while others, which I shall criticize, are very misleading. I would like to have every reader of the Mechanical Department of the MAGAZINE preserve their copy of the April number and watch the controversy, as Mr. Garaghty will doubtless defend his position.

In regard to disconnecting an engine, I shall advance some ideas which I have practically demonstrated, to my own satisfaction, and to the satisfaction of master mechanics I have worked for, to be a great improvement over the old idea that a great many men seem to entertain, to-wit: that if anything happens out on the road, no matter where or how the first and only thing that can be done is to disconnect. While on this portion of my argument I shall not try to prove anything by the indicator; yet, as a whole, it will play an important part. Too little is known about that little instrument from the ash pit man to the bloated bondholder. And what an opening of eyes there would be among those latter gentlemen if they could get a few cards from their managing and financing departments. There would be an entire new distribution of—well, it might not be—steam ordered at once.

To begin, I shall take Mr. G.'s first question and answer, "What is clearance?" "Clearance in a cylinder is the space allowed for the piston to clear the cylinder heads when engine is on the centre." Mr. Garaghty has not answered the question at all. His is no more a proper definition of clear-

ance than it is proper to say that a wedge is "stuck up." Evidently Mr. G. has never had any experience in working up indicator cards. If he has he merely gives his definition to provoke controversy. All first class engine builders, when economy is the object to be attained in the distribution of steam, claim, and the indicator proves it, that one of the most important points in the economical distribution of steam is to construct the position of valve and steam ports so as to reduce the clearance to a minimum. Now I hope the engineer or fireman who has accepted Mr. G.'s definition will, right here, stop and ask himself, what has the position of valves and steam ports got to do with clearance? If he studies it out for himself he will have a definition of clearance that will be worth more to him than any other he can get. Concisely stated, clearance is the space from the piston, engine on center, through steam ports to valve face.

Arthur L. Parshall.

ALBUQUERQUE, N. M.

#### To Run by Air Pressure.

MR. EDITOR:—In answer to J. M. Bunker's questions in the March MAGAZINE, I would say that air enough could be accumulated to run the engine the last mile by placing the reverse lever in back motion and opening the throttle, until engine is nearly stopped. Then throttle should be closed and lever put in forward motion until sufficient headway is attained to repeat the former operation. In this way sufficient pressure might be accumulated to run the engine last mile. Second, The air pressure will overcome the steam pressure. Third, No; as the principle on which the injector works is that of the condensation of steam, and water will not condense air.

J. W. Cook.

OLEAS, N. Y.

#### Questions on Brake Handling.

MR. EDITOR:—I would like to have some of your correspondents answer the following questions: First, Suppose you are pulling a passenger train of four cars, all equipped with the Westinghouse air brake. The cylinder on the front car is 10x12 with seven inch piston stroke and leakage groove in cylinder. The rear car has a 10x12 cylinder with a three inch piston stroke and no leakage groove in cylinder. Now, suppose you make a service application of eight pounds, will you get more pressure in the front car than in the rear one, or will the pressure be equal? Second, Suppose you have a car with a three inch piston stroke and no leakage groove in cylinder. You make a reduction of about eight pounds and get about 62 pounds in brake cylinder. Now,

if instead of this slight reduction you make an emergency reduction, will the pressure in the car cylinder exceed that of the train line or auxiliary, train line pressure not to exceed seventy pounds?

BRADFORD, PA. James W. J. Droney.

#### The Varied Uses of Electricity.

According to the account given by a correspondent, Great Falls, Mont., appears fairly entitled to the distinction of being called the Electric City. At Black Eagle Falls, three miles above the town, an immense dam has been thrown across the Missouri, and hydraulic works and power-houses erected. Not only are the street cars propelled and lighted by electricity from the power-houses, but they are heated as well by electric radiators placed in each car. Elevators, printing-presses, cranes and all kinds of machinery are operated by the ubiquitous force. There are automatic excavators, electric pumps and electric rock-crushers. A not uncommon sight on the streets is a mortar-mixer attached to an electric wire leading down from a pole. The restaurants cook by electricity, the butcher employs it to chop his sausages and hamburger, and the grocer to grind his coffee, and so likewise does the tailor to heat his goose. The subtle fluid is a welcome blessing in every home; the housewives run their sewing-machines and heat their flatirons by electricity; they bake their cakes in wooden electric cake-ovens that can be set away on a shelf like paste-board boxes. They have electric boilers and broilers and teakettles. What a singular anomaly when one pauses to think of it; that of broiling steaks and heating flatirons through the instrumentality of a waterfall!—*Engineering Magazine*.

MR. EDITOR:—In answer to J. A. Harrell's question asking which would release the easiest, the six inch or eight inch piston travel: The eight inch will release the easiest on account of the air equalizing at a lower pressure. If Mr. Harrell is a good operator he can release the eight inch piston and hold the six inch piston by restoring train pipe pressure equal to that in auxiliary in each case.

GRAND RAPIDS, MICH. L. A. Ogden.

It is not generally known that India rubber expands by cold. This was shown by Professor Dewar at a lecture recently. A piece of rubber tissue was stretched like the head of a drum and cooled locally by the application of a pad wetted with liquid air to minus 180° or so. Whenever touched by the cold pad the rubber expanded into puckers, which stretched tight as the rubber got warm again.—*The Engineer*.

**The Richmond Compound Locomotive.**

In our last issue we gave a description of a trial of the Richmond Locomotive Works' two cylinder compound, which has been doing some good work of late in regular service. Reference was then made to the fact that some interesting figures showing its performance in comparison with sixteen simple engines of the same series and carrying the same pressure, which figures we were not at that time at liberty to publish. We have now obtained permission to do so and present them without comment:

	General Average sixteen simple engines.	Compound 421.
Engine miles—freight . . . . .	2,844	1,128
Miles to one ton of coal . . . . .	16.91	24.00
Miles to one pint of oil . . . . .	10.56	6.06
Pounds of coal per engine mile . . . . .	118.27	83.33
Car mileage . . . . .	63,575	26,694
Average cars hauled . . . . .	22.4	23.7
Average cars hauled 1 mile per ton coal . . . . .	379 0	568.8
Pounds of coal per car per mile . . . . .	5.29	3.52

—Locomotive Engineering.

THE Sunday rest reform on railways has not been entirely abandoned, although it must be confessed that of late years the tendency has been rather to increase than diminish train movement on that day. All managers admit the desirability of giving every man one day's rest in seven, and some of them have practically discontinued freight service on Sunday. The New York Lake Erie & Western railroad has issued an order to hold all common freight trains in the yard from 12 o'clock Saturday night to 12 o'clock Sunday night every week in the year, only the necessary crews to handle fast and perishable freight being kept at work. The passenger service also has been greatly modified so that the station agents and telegraph operators will get a few extra hours' rest Sunday. The order affects nearly 8,000 men, half of whom will get an entire day's rest, the other half being required to work only two or three hours Sunday. We believe that this arrangement will increase efficiency, safety and economy in the Erie service and greatly promote the happiness and welfare of the employees.—*Railway Age*.

Is a circular issued by the Traveling Engineers' Association, calling for information on the operating of locomotives, the question is asked, What is the average time your engines are waiting for trains? This is a small question with a big tail to it. On some roads the engines are expected to be sent to the starting point for the train at

the schedule time, and then they often stand for hours waiting. In this kind of waiting service, coal is burned sufficient to pull the train over a considerable part of the trip. With the telegraph system now in use there is no excuse for keeping engines waiting in steam for hours to take out trains that are late. It indicates bad management if the motive power department is not kept informed of the hours at which trains may be expected to arrive. This useless waiting for trains wastes more fuel than those responsible for it are aware, besides keeping crews on duty many extra hours. The expensive leak ought to be stopped, and the Traveling Engineers will do an important service to railroad companies if their investigation directs attention to the magnitude of this waste.—*Locomotive Engineering*.

ALTHOUGH the intramural elevated railway at the world's fair seemed to be a demonstration of the adaptability of electricity as a motive power, yet it is said that the managers of the Metropolitan elevated road which is soon to be opened in this city have given up the idea of employing that medium, after long and careful investigation, and will use steam locomotives. Yet elevated railways possess certain manifest advantages over surface roads for the transmission of power by wires. Evidently engineers have grave problems yet to solve before the manifest destiny of electricity is realized. Two or three more elevated roads are already proposed in Chicago, and a sub-railway to form a loop road under the center of the city has been chartered, so that there is still a wide field here for inventors and experts in electricity.—*Railway Age*.

ELECTRIC locomotives are proving themselves to be well adapted for use in coal and other mines, and they now furnish the motive power for hauling cars in about 30 mines in the United States. They are designed to occupy but little, if any, more space than the cars they haul. With any other method of traction considerable more height and width is necessary. In coal mines in which there are narrow seams this is especially noticeable, as much rock has to be blasted away to admit of the passage of mules. By using electric locomotives the blowing down of the roof is entirely done away with. The increased speed also permits a larger tonnage to be taken from the same outlet, and with fewer turnouts, switches and cars.—*National Car and Locomotive Builder*.

THE elevated railroads of New York city carried 8,000,000 more people during 1893 than during the previous year. The figures for 1892 were 213,000,000 passengers carried.

while 221,000,000 passengers were carried during 1893. Twenty new engines were ordered during the year. The number of passenger coaches employed in the service is 1,116, and 75 new ones were added during the last four months. Improvements in the structure continue to be made, and the light 50 and 60-pound rails are being replaced by 90 pound rails. The locomotives consume over 200,000 tons of the best white ash anthracite per year. The coal makes no smoke. Over 3,000 trains per day are run, the exact number being 3,300. The employees number 5,000, and all are paid by the hour. Twelve hours is the longest time any man is required to work per day on the roads. The maximum pay is \$3 50 per day. Engineers earn \$100 per month.—*National Car and Locomotive Builder*

A LARGE proportion of the cities of this country are in a chronic condition of complaint at the exorbitant price charged by the gas companies for gas. That the complaints are well founded is proved by the citation of instances where, through the restraining influence of legislation, the price is much lower. This high price is bad where workshops are lighted by gas, and it is particularly bad for the small gas engine trade. The gas engine is one of the most popular means of furnishing small power, and can very well hold its place if it has a fair chance in the price of gas. But, handicapped as it is in many cities, it is at a disadvantage that does not belong to it by right; unnecessarily high price for gas is a detriment to a hundred small manufacturing interests in a large city, and it looks as if the outcome would be that cities will find themselves compelled to furnish gas as well as water to the citizens.—*American Machinist*.

LAST July we made the remark, in commenting on the discussion by the Association of Master Mechanics on the compound locomotive, that from the mass of contradictory testimony it was difficult for an unprejudiced observer to tell "where he was at." Recent reports from widely different sections of the country, show that a very decided saving of fuel is effected by the compound. This seems to be assured, but the unprejudiced observer is still looking for data regarding expense for repairs, and on this point information seems to be difficult to procure. There seems to be no good reason why a well-designed compound should be more expensive to maintain than a single engine, except in the matter of the larger cylinder; but the very fact that they are new, that none has ever worn out, and that repair records are not published serves as a check upon their introduction.—*American Engineer*.

THE new engines recently built by the Pittsburgh Locomotive Works for the Manhattan elevated are the largest yet used on that road. They are designed to haul a load of five cars weighing 29,000 pounds each, or 145,000 pounds in all, on a grade of 2.5 per cent., and at a maximum speed of 25 miles an hour. The Belpaire firebox is largely used on the road, the first engine equipped with it being built in 1887, and in the new engines there is a combination of the Belpaire firebox and the extended wagon-top boilers. The first combination of the Belpaire firebox with an ordinary wagon-top boiler was employed on the Brooks eight-wheel express engines built for the Exposition Flyer on the Lake Shore & Michigan Southern railroad. The new engines have driving wheels 3 feet 6 inches in diameter, cylinders 12x16 inches, and a boiler with a working steam pressure of 140 pounds, and Eames vacuum brakes. The total weight of the engines is 47,000 pounds, of which 33,000 pounds are on the drivers.—*Railway Age*.

THE air of this country seems to have a beneficial effect on Italians, at least they are moving against the padrone system by which the latter pockets just about half the money paid to laborers by the city of New York, and gets a big bonus for supplying contractors and corporations with laborers. The whole padrone system is scarcely removed from slavery, and is much worse in some respects.—*American Machinist*.

#### Measuring High Temperatures.

Professor Roberts Austen, in England, has recently devoted much attention to the measurement of very high temperatures, and has obtained results of great interest in connection with the molecular structure of alloys. He has now turned his attention to providing a recording pyrometer for use in works, and this new instrument he exhibited together with some remarkable photographic curves obtained by its aid. The pyrometer itself is a thermo-junction of platinum and platinum alloyed with rhodium; this is attached to a galvanometer and the spot of light from its mirror is received on a revolving drum covered with sensitized paper. The curves exhibited gives a 24 hours' record of the variations in the temperature of the blast supplied to furnaces smelting iron. It is thus possible to account for variations in the working of these large structures, and by insuring regularity of work to avoid the occurrence of these variations; also to effect economies of fuel.—*American Engineer*.

THE total amount of new track built in the United States in the year 1893 is 2,585 miles; in Canada, 433 miles.

## WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER.

Letters for publication should be directed to Mrs. Ida A. Harper, Stanford University, California.

### JUNE.

Brightest month of all the year:  
Beautiful fragrant June.  
All things seem happy since she is here.  
Bright, merry month of June.

Now the rose of perfume sweet,  
Scent the balmy air;  
Now the wild flowers at my feet  
Seem to me more fair.

Now bright birds of every hue  
Through the shady grove;  
Now the sunlight on the dew,  
Lingers as with love.

Roses, sunlight, birds and flowers,  
Are to drive dull care away;  
But still there's one sad thought in June:  
"She too must pass away."

LEADVILLE, COL.

Nellie Lawless.

### THE PRESENT STATUS OF WOMAN SUFFRAGE.

Every one who follows the history of current events through the daily reading of the newspapers, must admit that the question of woman suffrage is becoming an important issue in the affairs of this country. There is scarcely a session of the legislature in any state that is not called upon to grapple with this subject, and it crops up, in one form or another, at many of the conventions and associations held for various purposes. People are understanding more fully than ever before the power that lies in the ballot, women are entering more actively into business and public life, and are beginning to realize the disadvantages of being without this influence. Since our last writing, the Iowa legislature has granted municipal suffrage to women with some property qualifications, and the bill awaits the Governor's signature. It passed the senate by a vote of 27 to 20, and the house by 51 to 39. We shall be able to give more particulars hereafter.

In Colorado the women have exercised the suffrage in the municipal elections for the first time, and the newspapers are full of commendation. None of the dire occurrences predicted have taken place, but the papers in all parts of the state compliment the women for their dignity, their business-like methods and their large vote. At Denver, in a majority of the wards, more than half the vote was cast by women; at Colorado Springs more than one-fourth more ballots were cast by women than by men. At Greeley and at Montrose women were elected city treasurers. The papers state that in many places there were flowers on the judges tables, and in one ward in Den-

ver the election was held in a conservatory. The Colorado Springs *Evening Telegraph* says: "Yesterday's results are a strong evidence of the power and efficacy of the woman's vote upon the side of good government." The Boulder *News* says, "It was an ideal election in every way. There was an air of refinement and courtesy that could be better felt than described, due to the presence of the ladies, and it was the general sentiment that the experiment of woman suffrage is already a success, and if the question were submitted again to-morrow, there would be few to vote against it." Scores of such extracts might be quoted. The Associated Press dispatches, which are supposed to be without bias, speak in complimentary terms of the success of woman suffrage in Colorado. The dreadful things that would occur when women were given the ballot have been held up as a bugbear, these many years, to frighten women from asking for it and men from granting it, but in every instance where they have voted the testimony is similar to that of Colorado. The practical test surely should be able to refute the foolish arguments which no longer ought to have any weight. And yet in the very face of this unimpeachable testimony from Colorado comes the action of the Massachusetts legislature refusing to grant municipal suffrage to women. There are no more highly educated and capable women in the country than in the state of Massachusetts; they pay taxes on millions of dollars of property, thousands of them are wage-earners, and yet they have been going before the legislature for eighteen years asking for a representation, and have been refused. Fifteen years ago they were granted school suffrage but anything more has been persistently denied to them. This year it looked as if they might secure their bill. In spite of every obstacle that could possibly be interposed, the bill passed the house of representatives by a clear majority of 122 votes and, although it was three times debated and three times voted upon, it held this majority for two months. When it came to the senate, one of the most powerful and persistent lobbies ever known in that body conspired to defeat it, headed by such men as Henry Cabot Lodge and ex-Governor Robinson and backed by the Liquor Dealers' Association. It is said that the latter raised a fund of \$20,000 to defeat the bill. The Boston *Herald*, which fought it bitterly, had the decency to protest against the manner in which it was defeated. It says editorially: "There is little doubt that, if it had not been for the liquor influence, the vote of a majority of the senators would have been in favor of municipal suffrage for women, and if there is no other way of putting a curb upon a thoroughly corrupt and corrupting influence in politics,

it is not impossible that in a year or two more, female suffrage may be carried through simply as a popular protest against this pernicious form of legislative dictation. But still the *Herald* stood shoulder to shoulder with the liquor element in opposition to granting women the right of representation. Notwithstanding the tremendous opposition the vote in the senate stood 23 to 13. A change of six votes would have carried the bill.

The speeches of the opponents were very amusing. One member opposed the bill because women are very conservative and their vote would not change affairs any; another, because women were so radical they would turn everything upside down; one, because the women would carry the state for prohibition; another, because women would become a tool in the hands of the rum power; the republicans, because the women would deliver the state to the democrats; the latter, because the majority of the women would vote the republican ticket; one member voted "no" because women would not use the ballot if they had it; another, because the women would all rush to the elections and leave their homes and children unprotected; one, because the franchise would make the ladies masculine and unwomanly; another, because he did not want any "hysterical voting." Do these things sound incredible? They are copied from a stenographic report of the debate. One speaker after another declared that "only a few misguided women wanted the ballot," although individual letters asking for it had been handed in to the committee signed by over 40,000 women. They declared that the people of the state were not in favor of it, although petitions had been sent to the legislature signed by 200,000 names. One member, Mr. Hayes, of Lowell, declared that "the quarrels that would arise from the passage of this act would require an insane asylum and a divorce court to be erected in every municipality in the commonwealth." He did not state just how he would "erect" a divorce court.

And so, after this burlesque was ended, the bill was voted down. If every man in Massachusetts represented himself and one woman by his vote, there would still be 43,000 women unrepresented, as there are that many more women than men in that state. But how can a man represent himself and a woman at the polls, any more than he can represent himself and a father or brother or son? If he cannot do this, then there are 700,000 persons, over 21 years of age, in Massachusetts who are deprived of representation.

In the progressive state of Kansas school suffrage was conferred upon women before the war. In 1887 they were granted the municipal suffrage. Now after thirty three

years trial of the one and seven years of the other, the legislature has submitted an amendment to the votes of the male citizens to give to women the full suffrage. The three political conventions, Republican, Democratic and Populist, will meet in June and early in July. It is earnestly desired that each of these conventions shall declare for woman suffrage, and for this end the speakers and leaders among the women suffragists are bending every energy. They are greatly in need of money to pay the expenses of speakers, literature for distribution, etc. During the many years of its existence this department has never asked for money for any purpose, but we think it is justifiable to suggest that those of our readers who are interested in securing suffrage for women can very materially assist by contributing to the Kansas campaign. The general officers of the National Woman Suffrage Association have prepared a Lucy Stone Memorial Box, which will be sent upon receipt of five cents. They are to be used for collecting small amounts from one's individual friends, and will be opened on Lucy Stone's birthday in August. We hope that all of our readers will send for one or more of these boxes and see that they are filled. Your gentleman callers will respond liberally to your request for dimes and quarters. Address Mrs. Harriet Taylor Upton, Nat. Treas., Warren, Ohio. At the municipal elections held in Kansas this spring the woman vote was the largest that has ever been cast. The great majority of voters were among the most respectable women in every community. The vote was divided among all political parties, but it was almost unanimous in favor of law and order. There is, however, an undercurrent of opposition to giving Kansas women the full suffrage, for various reasons, and the battle will not be won without a fight.

Before this reaches our readers the Constitutional Convention of New York state will have met and the question of striking out the word "male" as a qualification for voters will have been settled. A vigorous campaign is being made and, in the city of New York, an unusual feature of it is the interest that is being taken by the prominent, wealthy and fashionable women. Heretofore they have kept aloof from the movement, but now, to quote Mrs. Livermore, "they have caught the divine contagion of an intense desire for justice," and are rushing about with petitions, holding meetings in their handsome parlors, organizing committees, opening headquarters and displaying great energy and enthusiasm. Among the active workers are found Bishop Potter, Dr. and Mrs. Rainsford, Mr. and Mrs. Russell Sage, Mr. and Mrs. Rockefeller, Frederic Couderc, Rabbi Gottheil, Rob-

ert Ingersoll, William Dean Howells, and a long list of equally distinguished individuals. It is amusing to read, in this connection, from the New York correspondent of the *San Francisco Chronicle*, that "professional agitators, like Susan B. Anthony, are kept in the background." Miss Anthony has spoken in every county in the state of New York, sixty of them, and is universally recognized as the bone and sinew of the movement. She is in demand from every quarter, and is speaking five times a week. As soon as the New York campaign is finished, she is booked for one hundred and twenty-five speeches in Kansas. This does pretty well for a woman seventy-three years old.

We have given an unusual amount of space this month to the subject of woman suffrage, because the present time seems to mark an important epoch in its progress.

#### A NOTEWORTHY SCANDAL.

As this article is being written, the decision of the jury has just been rendered in the Pollard-Breckenridge breach of promise case at Washington, D. C. The plaintiff gets a verdict for \$15,000. She will never receive any money, for the defendant belongs to that improvident, spendthrift class of public men who spend their income much faster than it comes in, deplete the pocketbooks of their friends, and live on credit as far as it will go. She has obtained, however, what is far sweeter than money, viz: revenge. It was for this alone that the suit was undertaken by a desperate woman, and we believe that when all the circumstances of the case are understood the average man and woman will not find it in their heart to blame her for pursuing the course she did. She had nothing to lose out of the wreck of her life, and she determined that the man who was responsible for this should go down with her. This may not be in accordance with certain scriptural injunctions, but it is a phase of human nature in which we can not help but sympathize, even though our higher moral convictions may declare against it.

The details of the case are no worse than daily confront us in the newspapers, and we would have passed them by without a reading but for the prominent position which, for so many years, has been held by the defendant. The circumstance of his being a member of congress would not cause his immoral career to excite surprise, for it is a deplorable fact that the lives of many congressmen are anything but models of virtue and integrity, but Col. Breckenridge always has posed as a man of the highest standard. His speeches have been replete with lofty moral platitudes, he has kept his church membership prominently before the public, he has gone about

over the land addressing Young Men's Christian Associations and Sunday school celebrations, and with fine southern chivalry has posed as the protector of defenseless women. And yet all these years he has lived a licentious and corrupt life, grossly unfaithful to his marriage vows, dishonoring the memory of his dead wife, and bringing in a second innocent wife to share his shame and disgrace. We do not have to depend upon the testimony of Madeline Pollard for this knowledge, Col. Breckenridge himself admits it upon the witness stand, without a blush or the quiver of a muscle.

One can scarcely recall anything approaching in its brazen effrontery the testimony of this man. He admits that at the beginning of their acquaintance he was nearly fifty, the girl under twenty, he a member of congress, a pillar in the church, she in boarding school, always taught to regard him with respect and reverence. He had a wife and a family of children. "No man in America had less excuse for such an action than I, with the domestic surroundings I then had," he declares on the witness stand. For nine years the relations were continued and, during this time, the Colonel introduces his mistress to the young girls of another boarding school; he takes her to the house of an old friend, an estimable widow, and, vouching for her purity, secures her a home there; he indorses her as a person of good moral character when she wishes to obtain a government position; the two children which result from these relations are disposed of without delay; within a week after his wife's death he is consorting with and promising to marry this girl; finally, he takes her to New York, registers her at the hotel as his daughter and lives with her up to the very day when he marries an estimable woman.

It would be hard to paint a blacker picture than this, and yet all the excuse that this man offers was the one originated by Adam, "The woman tempted me and I did fall;" and his sole endeavor to escape was based upon the unsuccessful attempt to prove that she had been betrayed before he met her. He made no charge that she was ever untrue to him during the nine long years that followed. A fitting climax to this most disgraceful story was the speech of defendant's counsel, Col. Phil Thompson, himself at one time on trial for having committed a murder. The press reports tell us that his anecdotes were unfit for publication, and his sneers at the seventh commandment called forth a universal protest. He justified his client's action, declaring "Both were pursuing a course of immorality agreeable to each other and telling any little lies that came along to

help each other out. Every man in the court has told lies about these little domestic matters. I don't see why this man, who is no worse than the rest of us, should be punished just because he was found out."

And now we have, standing out in clear and beautiful relief against this dark background, certain features which lift us into a higher moral atmosphere and revive our faith in humanity. First, is the attitude of the press; almost universally has it condemned the Breckenridge standard of morals. This has not been the expression of the religious press alone, but of the secular, also. There has been no attempt to palliate or condone the immorality of the defendant, but there has been an almost unanimous voice of scorn that he should attempt to save himself by still further degrading the woman he ruined, and a demand that he should retire from public life. A second admirable feature is the stern, inflexible and austere bearing of Judge Bradley excluding, as far as the law would permit, the vulgar curiosity-seekers from the court room, restraining any undue exhibitions by counsel or witnesses, and keeping the case as much as possible within the bounds of decency. Third, is the courageous and highly commendable speech of Judge Jere. M. Wilson for the plaintiff. He declared the principle, which the world is only just beginning to recognize, that there must be but one standard of morality for both men and women, and that the man must share with the woman in the results of sin. He characterized the plea of Adam laying the blame on the woman as that of a craven and a coward. It was a brave speech which deserves to be engraved on tablets of stone. Fourth, is the verdict of the jury. It is in the highest degree creditable to them that they made no compromise with infamy. If all men are guilty, as Col. Phil Thompson declares in his speech, it would not have been strange if a portion of this jury had sympathized with the defendant, but it is to their everlasting credit that they put a unanimous seal of condemnation upon his hypocrisy and depravity. Fifth, is the action taken by the women of the country. From far and wide comes denunciation of Col. Breckenridge's immoral life and shameless acknowledgement of it. Flowers, letters of congratulation and resolutions of approval have been sent to Judge Wilson by ladies of the highest social standing. At Lexington, Ky., a petition to congress to impeach Col. Breckenridge is being signed by many distinguished women. Many organizations and societies have made this the occasion of declaring that men and women must be measured by the same standard of morality.

From these observations we must con-

clude that this great scandal case has not been wholly demoralizing to the public. It has opened up some social questions which needed revising. An object lesson like this is of more weight than a story or a drama. It carries its moral for both women and men, that the wages of sin is death in one form or another. Whether or not congress takes any action in the matter, Col. Breckenridge will never regain his former prestige in that body. Whether he is re-elected remains to be seen. He probably will seek a re-election as a vindication, and his constituents may stand by him to prove the truth of Col. Thompson's declaration that all men are sinners in this regard, and must stand by each other. We venture the assertion that if the women of his district had a vote they would not choose to be represented by this man. The suggestions to his wife that she secure a divorce at once are very impertinent. That is a strictly private matter for her alone to decide. The fact that she would drive down Pennsylvania avenue with Col. Breckenridge while the newsboys were crying the verdict indicates that she means to remain with her husband. That he should subject her to this ordeal shows the supreme callousness and brutality of the man. The weakest part of a woman's nature lies in her affections, but, since herein also is her greatest strength, we can not criticise. All right-thinking people will hope that the principals in this revolting case will retire from the public gaze and keep out of sight. It has carried its lesson, which should be remembered and heeded, but the actors and the scenes in the melancholy spectacle should be forgotten as soon as possible.

#### BE OF GOOD CHEER.

A reply to "The Heart's Secret Chamber," by Nellie Bloom, in April MAGAZINE.

Your poem has a mournful strain,  
It speaks of sadness, dark and drear,  
Of uncheered loneliness, rayless night,  
And friendship's severed ties, once dear.  
Oh, would that I could give you cheer!  
Bring back those happy, by gone years,  
Breathe gladness into your tired soul,  
And brush away the crystal tears!

Open "The Heart's Secret Chamber," friend,  
And let in the bright, shining sun:  
It may bring gladness to those smiles,  
And joy may be partially won.  
I do not think that it was meant  
That sorrow should our portion be,  
For sweet contentment fills my heart,  
And love for love is given me.

It is not gold or precious gems,  
That give me happiness and joy,  
But friends, a loving husband, dear,  
And a darling, dark-eyed, baby boy.  
Oh, why be sad? for nature smiles  
Alike on all, if you but see,  
Why should the Father not be kind  
To you as well as unto me?

NEEDLES, CAL.

Mrs. A. D. Ensign.

### DRIFT OF THE MONTH.

The number of women physicians is rapidly increasing in all parts of the country. In Boston there are a number whose income is expressed by five figures. This year twelve southern women will graduate from the Woman's Medical College of Pennsylvania. It is accepted now as eminently right and proper that women should practice medicine, but when they first attempted to enter this profession, in this land of the free and home of the brave, the opposition was so great that they had to go to Vienna and St. Petersburg, in Europe, to obtain their education.

On the last day of its session the general assembly of Kentucky passed what is known as the "Husband and Wife Bill," and it was signed by Governor Brown. This bill wipes out the disgraceful property laws relating to married women which have always prevailed in Kentucky. It gives to the woman entire equality with her husband in the ownership and control of property. She can make a contract and carry on business in her own name. A widow and widower are given the same rights in the estate of the one deceased. It is a radical measure and a great credit to the members of the Kentucky legislature.

Mrs. Zerelda G. Wallace, one of the beloved mothers in Israel of the temperance and suffrage cause, is as truly a friend of men as of women. She expresses herself thus beautifully:

I rejoice over the results of the woman's suffrage campaign in Colorado, not so much that the women have the suffrage as because the whole thing shows the progress and development of men quite as much as of women. Talk as much as we may of the progress of women, the whole question resolves itself into this: That until men grow just, broad and grand, they will never deal righteously with us or themselves. Hence I feel that the attitude of the men in Colorado is the most hopeful feature. It is only the beginning of the end. Let us thank God and take courage. Humanity will in time reach its high destiny and vindicate its claim to divine origin.

The Young Woman's Christian Association of Boston conducts an excellent training school for domestic service which this year will have forty-four graduates. Its various classes have contained 800 students. It also conducts a Traveler's Aid Society which has assisted more than 1700 young girls. These are only two features of the splendid work it is doing. Our young people should remember this when they are inclined to sneer at religious institutions. While some of them undoubtedly are open to criticism, yet much if not most of the charitable work of the world will be found to be under religious auspices.

After a long and patient struggle, the Woman's Council of Cleveland, O., has at

last succeeded in securing police matrons for that city. Two excellent women have been appointed, one of them a widow with a mother and two little children dependent on her for support. She will receive \$666 a year, just two thirds the salary of a policeman. Fifty-five dollars a month is not a great deal for the support of four persons. Cleveland is to be congratulated on this new departure, however, and, after a year's experience, she will wonder how she did without women police matrons.

Mother Husband, the famous war nurse of the army of the Potomac, recently died in Washington city. She was the granddaughter of William Morris, one of the immortal signers of the Declaration of Independence. While her two sons were fighting at the front, she was devoting her life to the hardest kind of hospital service, which she continued till the close of the war. Did she not serve her country as effectually as any soldier in the ranks?

Rev. Anna Shaw is the only ordained Methodist minister in this country, and she is also a very witty and forcible lecturer. She is often called upon to perform the marriage ceremony and, in a recent speech before the Association of Pilgrim Mothers, she said:

I never use the word obey in the marriage ceremony. I wouldn't marry a woman that was such a fool as to promise to obey a man in everything and mean it. I wouldn't marry a woman that was such a liar as to promise to obey and not mean it. There is nobody that knows so much about the duty of a wife and mother or is so ready to tell what he knows as a very young man who has never tried being either one.

### A recent writer says:

Pecuniary equality will be the natural result of political equality; but while we are laboring for the latter, the woman who contemplates marriage should have a clear and candid understanding with her intended husband. If he is not sufficiently enlightened to perceive that she has an equal right with him to the common property, then she should teach him the lesson. If she cannot do so, she had better avoid a closer connection with him. A business arrangement should be made, by which the income is divided into three parts, one for current household expenses and one for each partner in the firm. When children come there should be a fourth division for them.

This is sound doctrine, and applicable in all households.

The Dundee (Scotland) Courier has dispatched two lady correspondents around the world to investigate, in the various countries, the questions of woman's work and wages and other questions of interest to women. They expect to travel about 25,000 miles, and their investigations will doubtless prove to be of great value.

A number of towns in Massachusetts have elected women as overseers of the poor. They are better fitted for this position than

men, as their judgment is usually more correct in regard to the amount and kind of relief that should be given, and they are more careful and economical in the expenditure of money.

#### NOTES.

We take pleasure in acknowledging the receipt of the wedding cards of our admired contributor, Nora Bull. She was married at her home in Prairie du Chien, Wisconsin, April 5, to Edwin T. Froelich. The cards announce that they will be "at home" in Froelich, Iowa. We extend warmest congratulations and wishes for a long, happy and prosperous married life. We hope the new wife will not allow her gifted pen to grow rusty from disuse, but that we may hear from her again when the honeymoon begins to wane and she finds some leisure time which she can claim for her own.

In the April number the poem entitled "The Heart's Secret Chamber," is signed "Nellie Bloo." Our readers will have no difficulty in understanding that it was written by our well-known correspondent, Mrs. Nellie Bloom, but such typographical errors are very annoying. Since coming so far away from the publishers it has not been possible for the editor of this department to read the proof, but we trust that the errors may be few in the future.

#### THE GREAT AMERICAN DESERT.

"Westward the star of empire takes its way."

Where once the Indian and the buffalo,  
In unchecked freedom roamed the barren lands,  
Where choked up rivers lost the way to go,  
And sunk exhausted in the parched sands—  
Now, nevermore the herds browse o'er the lea;  
Their dry, bleached bones have almost ceased to be.

In early days long trains of wagons moved,  
Huddled, across the barren, sandy waste,  
With anxious inmates, whom it well behooved  
To look alert for foes in every shadowy place.  
Now, never comes the red man skulking there;  
Decked in his war-paint, feathers in his hair.

Where wagons snail-like crept in days of yore,  
And weeks elapsed before the goal was won,  
Now speed the mighty trains with rush and roar,  
And cross the wide expanse from sun to sun.  
In less time than it took those emigrants  
Now one can cross the entire continent.

Where erst none deemed the plains as fit  
To raise an habitation lone thereon—  
The prairie dog from countless holes would flit,  
And rattlesnake glide out 'neath the warm sun—  
Where many moons elapsed between the rains  
Were swallowed into fever parched plains—

Now lowly homes dot here and there the land,  
And towns in midst of desolation show  
The mighty and reclaiming work of man.  
And from the vast and arid desert slow shall grow  
A prosperous land. As Holy Writ foreshows,  
The desert yet shall blossom as the rose!

COLORADO.

Grace Lei Dunning.

[Accompanying the above poem came the handsome photograph of the writer and an exquisite book of pressed wild flowers of Colorado. They are as perfect in form and

color as when gathered from the field and mountain side. I can hardly put into words my appreciation of the kind thoughtfulness that would prepare so beautiful a souvenir for one who is a stranger, except as we all feel acquainted through the columns of the MAGAZINE. It will take its place among my most cherished mementoes.—Ed.]

#### Woman's Dress and Rights.

I read an article in the MAGAZINE this month from Carl E. Kreische on dress reform, and must say he has strange ideas for a man. It may be all right for Dr. Mary Walker to wear bloomers, or for a woman who has adopted a public calling, but for a wife I don't approve of it. To begin with I don't think a woman should try to copy after men, for she forgets herself when she does so, whether it is in dress or habits; and as for ennobling her in man's eyes I don't see how it can. I should think it would be to the contrary, as the average man is apt to say, "Why should I be more polite to her or show her any more deference than I would a man; she puts herself in a man's place, why shouldn't I treat her the same?" Why shouldn't they? For there is nothing gentle and ladylike about such costumes to recall a treasured mother's memory or gentle looks. I agree with the gentleman, however, about the long trailing dresses women have been wearing lately. I don't think they look nice trailing in the dust and dirt, by any means; I don't believe they promote health either, but if women would make a practice of dressing comfortably and neatly without so much cloth in their skirts to weigh them down, they would certainly be stronger, but it is not necessary to wear bloomers to accomplish that.

I see again this month another piece about the equality of men and women and woman's rights. What are woman's rights? That is a question that few seem able to answer at the present time. The general opinion of woman's rights seems to be that she must vote to have her rights. How mistaken I think that is. She has always had them if she had chosen to use them. But they have lain dormant as a butterfly waiting for spring, until the last few years, when, behold, there is a great clamoring for rights. They want more rights and don't exercise those they have. They have the rights to control nations and don't do it. If the women that want to vote would bring up sons with the right principles of honor and freedom they would not need to vote, and I say the same of those women who travel around the country as heroines, lecturing on temperance. If those of them that have husbands were to stay home and keep their house clean and raise sons who would abhor liquor, and let them spread

their influence with their companions, I don't think there would be any need for them to travel and lecture. The great trouble with our American women of to-day is, they are getting to think it a disgrace to raise a family, and that is the reason they are stepping in public places where they should raise sons to step. Not that woman hasn't the intellect to fill such places, for where do men get their intellect from if not from the mother who succors them? Women are lacking physically, not mentally, for the position they are trying to fill, and they will find it out before many years. I could say a good deal more on this subject, but I don't wish to tax your patience or the readers' longer this time.

LOS ANGELES, CAL.

#### LOVE'S OFFERING.

I wear your letters o'er my heart,  
 'Tis there they softly rest,  
 They seem to soothe the soul's keen pain,  
 That lurks within my breast;  
 Their precious contents oft I've read—  
 Cherish each word you've said—  
 In life I'll wear them o'er my heart,  
 They'll lie there when I'm dead.

The love you say you bear for me,  
 I read in every line,  
 But fate has willed that we must part—  
 That I can ne'er be thine;  
 But in those white-winged missives, dear,  
 Are loving words you've said—  
 In life I'll wear them o'er my heart,  
 They'll lie there when I'm dead.

Some friendly hand will place them there.  
 'T will be my last request  
 Their fond and tender words of love,  
 Will be a mute caress;  
 E'en though our paths do lie apart,  
 As thou hast oft times said;  
 I'll wear your letters o'er my heart,  
 They'll lie there when I'm dead.

When I beneath the coffin lid  
 Shall sleep in death's embrace,  
 When I no more can read the lines  
 Your loving hand has traced  
 Upon each page, so dearly prized,  
 O'er which sad tears are shed,  
 Your letters that are mine in life,  
 Will still be mine when dead.

WEST OAKLAND, CAL.

*Nellie Bloom.*

#### Dress Reform.

I am glad of an opportunity to say a few words on the subject of dress reform, for I can speak from experience, having worn the Bloomer dress for more than a quarter of a century. I adopted it at the age of twenty-four, wore it through scoffs and sneers and was married in it, one of the guests remarking that it was the first time he ever saw two pair of pants married. I am the mother of nine children, and I believe my invariable good health was greatly attributable to my mode of dress. I had been deterred from wearing the short dress as long as I lived, knowing that it was the

most convenient, comfortable and healthy dress in the world, and even refused my choice of a silk dress if I would make it up long. But, alas! for human resolutions; as the years went by and I was still alone in my dress, my courage began to weaken, and at the earnest solicitation of growing daughters I went back into the bondage of long skirts.

FARGO, N. D.

#### A Touch of Nature.

He was a locomotive engineer, rough, gruff and surly. He had commenced the battle of life at an early age, and had received what education he possessed amid the coarse and crude surroundings of railroad life. He had entered the service of the corporation a quarter of a century before as a hostler in the round house, and by constant and faithful application had at last arrived at the goal of his boyhood's ambition and stood on the right side of the locomotive. His early life had been devoid of pleasure. His nature was like the material of the engine which he directed—hard and inflexible. His associates said that his heart was without sympathy, that it was never known to throb with that kindred feeling which diffuses love and sunlight unto the dark recesses of this troubled world.

He married late in life, when he felt himself amply able to support a family. People said that he married for convenience and a home, that love on his part had never entered into his calculations. Children came to bless the union as the years rolled by, but still his nature remained unchanged; he might have loved his family, but never by word or action did he evince the least concern regarding their welfare. He had few associates and fewer friends; he gained the reputation of being hard-hearted, hard-fisted, cruel and tyrannical. Utterly ignoring public opinion, and refusing the companionship of his fellow employes, he lived, from day to day, month to month, the faithful, methodical and unsympathetic servant of the corporation whose only recognition of his faithfulness was shown on their monthly pay rolls.

One day in mid-winter his train was behind time; the weather was dreary and dismal, a mist was falling, freezing on the rails as it fell, rendering progress up grade slow and difficult. The train reached the summit of the grade fifteen minutes late; this must be made up in order to make connection with another road. The engineer had a horror of being late; he pulled the throttle viciously and the train whirled at a terrific rate of speed down the grade; faster and faster it sped on towards its destination; five minutes of the lost time had

been made up; at this rate he would make the connection on time. With his hand firmly clapping the throttle, his eyes fixed steadfastly on the track ahead, he appeared like an immovable fixture of the locomotive, placed there for the purpose of infusing faster speed into the being of iron and brass, which obediently obeyed his master hand.

A curve looms up ahead; there is no time to apply the brakes to ease the momentum of the train; the connection must be made; the curve is gained; the engineer with his eyes strained upon the track ahead, beholds standing in the center, directly in front of the locomotive, a little girl apparently about eight years of age. The child, dazed and bewildered by the thunder of the approaching train, stands motionless; the hissing, steaming mass of metal continues to dash forward; the engineer with superhuman effort, seizes the reverse lever and applies the emergency air brakes; the brakes close on the wheels with a sudden clasp and grind, the machinery of the locomotive groans under the terrible strain; for an instant he beholds the supplicant features of the child gazing up at him in hopeless terror; he instinctively closes his eyes; the train continues to move forward over the sleet-covered rails; there is a muffled jar and the engineer knows that all is over; he opens his eyes, the track in front of the locomotive is clear. The train is at last brought to a standstill, the engineer hurriedly alights and walking rapidly back up the track, he observes a crowd of passengers congregated in a group on the bank near the track; he rushes through the crowd, roughly elbowing his way to the center. Upon the ground lies a mass of mangled human flesh, the cinder-blackened snow is covered with red spots; he stands gazing upon the mutilated remains for a moment, then suddenly kneeling on the clump ground, he gently raises the shapeless mass in his arms with the tenderness of a woman, strokes the matted and blood-stained hair from the forehead and gazes with an expression of the deepest agony into the upturned face; gradually tears, which, maybe, have been welled up for years, begin to flow down his smoke-begrimed face, dropping like rain upon the features of the child; he stands thus for several moments, apparently unheeding of the surrounding crowd; at last he seems to suddenly recollect his duty, and with a sob which he made no effort to suppress, he gently replaces the body on the ground, and turning to the affected bystanders, says: "Boys, it may appear to you unmanly and womanish for an old railroader like me to take on like this, but I've got a little girl up in the country about this little one's age, and may God in His mercy spare

her from any such fate as this;" and without another word he makes his way back to the engine and the train moves on toward its destination.—*Railroad Employee.*

#### A Moving Mountain.

A traveling mountain is found at the Cascades of the Columbia. It is triple-peaked mass of dark brown basalt, six or eight miles in length where it fronts the river, and rises to the height of almost 2,000 feet above the water. That it is in motion is the last thought that would be likely to suggest itself to the mind of any one passing it, yet it is a well-established fact that this entire mountain is moving slowly but steadily down to the river, as if it had a deliberate purpose some time in the future to dam the Columbia and form a great lake from the Cascades to the Dalles.

The Indian traditions indicate immense movements of the mountains in that region long before white men came to Oregon and the early settlers—immigrants, many of them from England—gave the above described mountainous ridge the name of "traveling" or "sliding mountain."

In its forward and downward movement the forests along the base of the ridge have become submerged in the river. Large tree stumps can be seen standing dead in the water on this shore. The railway engineers and brakemen find that the line of the railway that skirts the foot of the mountain is being continually forced out of place. At certain points the permanent way and rails have been pushed 8 or 10 feet out of line in a few years.

Geologists attribute this strange phenomenon to the fact that the basalt, which constitutes the bulk of the mountain, rests on a substratum of conglomerate or of soft sandstone, which the deep, swift current of the mighty river is constantly wearing away, or that this softer subrock is of itself yielding at great depths to the enormous weight of the harder mineral above. —*Goldthwait's Geographical Magazine.*

#### THE PRAYER.

Dear Lord! Kind Lord!  
Gracious Lord! I pray  
Thou wilt look on all I love.  
Tenderly to-day!  
Weed their hearts of weariness;  
Scatter every care  
Down a wake of angel wings.  
Winnowing the air.

Bring unto the sorrowing  
All release from pain;  
Let the lips of laughter  
Overflow again;  
And with all the needy  
O divide, I pray,  
This vast treasure of content  
That is mine to-day.

—James Whitcomb Riley.

JUNE, 1894.

### JUDGE CALDWELL AND THE UNION PACIFIC EMPLOYEES.

When a man is summoned to give testimony in court, and takes an oath to tell the truth, any eulogy touching his veracity becomes a questionable compliment, an intimation that "the truth, the whole truth and nothing but the truth" had been in peril, and that the witness had been, fortunately, rescued from the unpleasant dilemma to which perjurers are sometimes subjected.

It appears that Judge Caldwell entertains views relating to the duties of a judge quite in consonance with those which devolve upon a witness—he does not like to be eulogized nor thanked for being honest and upright—as is shown by the following incident:

Chairman Vrooman of the B. of L. E. thanked the judge for his decision, whereupon, the judge, quick as a flash, replied: "No thanks are necessary, Mr. Vrooman. *when a court does its duty clearly, without fear or favor, it is not deserving of thanks.*"

These were words "fitly spoken," as beautiful and as valuable as "apples of gold in pictures of silver." Judge Caldwell is evidently made of the right sort of material—a large per cent. of iron and sand, with no intermixture of sawdust, putty or caoutchouc. Nevertheless, Mr. Vrooman is not to be seriously criticised for thanking Judge Caldwell for his celebrated decision, since every honest man in the country feels thankful for his verdict, for, notwithstanding it was not entirely unexpected, when it came it was phenomenal—a revelation, that

at once set a revolution in motion. Judge Caldwell's decision was eminently natural and rational, direct and honest, distinguished for its law and common sense, and justice to all parties.

In this connection it is pertinent to remark that it was these characteristics that created wide spread surprise. We have remarked that a decision was expected in which something would be said differing from the decision of Judge Dundy, and workingmen entertained hopes that some relief would be granted them, that they would receive honorable recognition, and their rights receive some judicial consideration, but they had so often, of late, been the victims of brutal judicial bludgeons, wielded by other United States judges, in the interest of receivers and corporations, that they were unprepared for declarations from the bench which emancipated them from the degrading grasp of ignorant and rapacious receivers acting in the interests of men who held millions, evidences of debts, but in fact representing the most stupendous frauds ever perpetrated in this country. Judge Caldwell, in treating this feature of the case, became, morally, heroic. He referred to the receivers, of whom four of the five were totally incapable of determining what wages employes should receive, and their opinions upon the subject were of no consequence, because they knew nothing about wage schedules, and while the judge expressed a prudent anxiety to have the road relieved of its financial embarrassments, he said, "to accomplish this desirable result the wages of the men must not be reduced below a reasonable and just compensation for their services. They must be paid fair wages, though no dividends are paid on the stock and no interest on the bonds." It is just here that Judge Caldwell puts some facts upon record, in such such a way that ought to strike dumb those who are eternally defending corporations as models of honesty, and lampooning labor organizations as the enemies of capital. Said the judge: "It is part of the public history of the country, of which this court will take judicial notice, that for the first \$36,000,000 of stock issued this company received less than 2 cents on the

dollar, and that the profits of construction, represented by outstanding bonds, was \$43,929,238.44." These two items represent \$79,929,528.44, of which at least \$35,280,000 was pure fraud, \$43,929,328.44, was a trick in construction, also a fraud upon innocent stockholders and the government.

After all, we inquire, what is there remarkable about the decision of Judge Caldwell that it should awaken continental interest? Truth never changes; justice is eternal; inalienable rights are immutable. Judge Caldwell grasped them and wove them into the woof and warp of his decision—a triumph of the judiciary over the world, the flesh and the devil, corporation cussedness and capitalistic greed. That the decision was phenomenal, rare, exceptional, is of itself an arraignment of the courts of the country. Judge Caldwell, erudite, profound and analytical, capable, abstruse, master of the technical in law and logic, like all great-minded men, states propositions which a wayfaring man can comprehend, and then, bringing the law of equity to bear upon the case, brushes aside subterfuges, sophistries, special pleadings, chicane and every vulgar trick, and blazes a way through the jungle of jugglery that leads men out into the clear light of common sense, which is always good law. He pays no attention to the sinuous trails of serpents, the pathways of trappers, the little elevations where prairie dogs bark, but knowing the right way, he illuminates it by the search lights of justice and wins the gratitude of a nation.

Workingmen—railroad employes, have believed that they had rights that should be respected, but time and again corporations, aided by judges, had struck them down, until railroad employes were being taught that only fines and imprisonment awaited them if they asserted their rights, but Judge Caldwell came to their rescue and told them, told the country, corporations and receivers, that, "In this country it is not unlawful for employes to associate, consult and confer together with a view to maintain or increase their wages by lawful and peaceful means any more than it was unlawful for the receivers to

counsel and confer together for the purpose of reducing their wages. A corporation is organized capital; organized labor is organized capital. What is lawful for one to do is lawful for the other"

It was this right, which had been struck down, that Judge Caldwell restored, and in the re-establishment of which he took occasion to remind employes and employers that railroad receivers cannot abrogate contracts at their own sweet will; that they cannot "hang employes and try them afterwards;" in a word, that laws are made for employes as well as employers; that courts are established to administer justice, and not for the purpose of aiding and abetting wrong; that in the United States "the period of compulsory personal service, save as a punishment for crime, has passed," an intimation that the courts which have sought to visit upon railroad employes "the pains and penalties of the early English statutes" perpetrated a damnable outrage, for which they should be impeached and disgraced forever. In announcing that railroad employes are entitled to fair wages, that contracts shall be respected, that employes shall be paid though the payment of dividends and interest on watered stocks and bonds is postponed, that employes have a right to organize and confer together in all matters relating to their welfare unmolested and unintimidated, we say, in making such announcements Judge Caldwell voiced eternal principles of right and justice, for which he is entitled to the gratitude of railroad employes and all the toilers of America.

The MAGAZINE has a right to indulge in no little self felicitation, because on numerous occasions since we have had control of its pages we have, in our way, advocated the principles laid down by Judge Caldwell in his masterly decision, and the decision absolutely vindicates the theories of law and justice we have advocated and maintained. The decision of Judge Caldwell is full of inspiration for workingmen to stand firmly by their organizations, and to be content only when they are awarded the fullest measure of their rights.

## THE OUTLOOK OF LABOR.

In every section of our broad land men, regardless of trade, calling or profession are studying the outlook of labor—prognosticating, questioning and reading the signs of the times. Capitalists, merchants, manufacturers, agriculturalists, politicians and statesmen, philanthropists and economists are profoundly interested in the outlook of labor. This is not surprising, since it is fundamentally true that when labor is prosperous general prosperity, happiness and contentment prevail, and when adversities befall labor every interest feels the baneful consequences. If hitherto such facts have not been fully recognized, they are now admitted and their force fully comprehended by all thoughtful men, and they are daily coming into more pronounced conspicuousness. Men laugh at the Coxey "commonweal" demonstration, when in fact it would be difficult to find its parallel in grim, haggard and dangerous characteristics. The calling together from all parts of the continent of a horde of men forced into idleness by no fault of their own, ragged, hungry and homeless, seeking work or subsistence, levying contributions as they march, everywhere creating unrest and alarm, is a spectacle which no prudent citizen can contemplate with composure. It is a symptom of a national disease ceaselessly boding evil. It is organized poverty, an army of hungry, ragged men, always on the verge of despair, inviting recruits from the ranks of the wretched and forlorn wherever they are found. On all sides we hear it said that Coxey is a crank, that no good can come to him, to his army, or to others by this "commonweal" demonstration. The conclusion is correct, no good can possibly come from forced idleness, prolonged hunger, such shelter for men as is provided for beasts, and often no shelter at all. No good can come from bringing together from east, west, north and south large bodies of men, who, if not clothed and fed and sheltered will find ways to obtain such essentials at any risk, because "hunger knows no law." Coxey, though he will not extort from congress the enactment of laws which operate to give the idle work, nor provide for them in any way,

it is becoming painfully apparent that he has begun a movement well calculated to breed discontent and make it epidemic throughout the country, and just what results will follow no one can fortell.

If an army of one hundred thousand enforced vagabonds should manage to reach Washington they would constitute an object lesson, such as the world never beheld since the Israelites marched out of Egypt through the Red Sea. Statesmen, politicians, philanthropists, educators and divines could contemplate it and exclaim, "Here is one of the evidences of progress, religion, education and civilization in a government of the people, by the people and for the people. Here is seen the fruits of class legislation. Here is an exhibition of plutocracy, corporation, trust, monopoly and robbery on the one hand, and poverty, hunger, squalor and degradation on the other hand. Here are two exhibits in the great Columbian Fair No. 2, held in the capital of the nation. A. D., 1894. Look! By all the pagan gods in a pile, above the army of *citizen* vagabonds, without food, clothes or shelter, floats the star spangled banner, 'Old Glory!'"

We do not suppose Coxey will march into Washington a hundred thousand hungry, ragged, shoeless, hatless, frost bitten American citizens, but it will not be because there are not one hundred thousand idle workseekers in the country, for there are millions of them, but enough will straggle into Washington to humiliate the nation—enough, as we have suggested, to make an object lesson for the study of statesmen, if any are found in the capital of the nation.

In studying the outlook of labor the inquiry goes round, What are employers doing to improve conditions? The reply is, in some cases nothing, in others as little as possible, while almost invariably those who are doing anything in the way of giving employment, a reduction of wages in some form is insisted upon. In numerous cases the cut is direct, ranging from 5 per cent. to 25 per cent., the average being fully 10 per cent. If, however, the wages per day or per hour are maintained the reduction is reached by reducing the number of hours per day, or the number of days per week,

often equivalent to a direct cut of from 10 to 50 per cent. Nor are these cuts of wages, direct and indirect, the only burdens imposed upon labor. In addition there has been going on a ceaseless discharge of employes who are forced into idleness without an opportunity to earn any rate of wages.

In carrying out their programme of reduction employers claim in every instance that they are in the grasp of imperative necessities that can not be avoided, the result of conditions they had no hand in creating, and which they can neither control nor modify. The facts seem to warrant such declarations. There is universal business demoralization—and what is being done is, as we have remarked, at reduced wages. It is not to be doubted that almost every form of investment in industrial enterprises pays, just now, small dividends or no dividends at all, and that in numerous cases operations are continued at a loss. Be this as it may, labor in the United States is paying the severest penalties ever imposed upon it since the government had an existence, and there never was a time in the history of the country when the outlook of labor was more gloomy.

The inquiry goes round, When can a change in the outlook be expected? In reply, men well posted in dates and data say that the panic of 1873, less serious than that of 1893, dragged along for six years, and that the country did not fully recover from its effects till 1879, hence no time can be named when the business depression now afflicting the country will disappear. Those who pretend to know whereof they speak, on the one side, contend that the good of the country demanded the coinage of what is called the "seigniorage" silver in the treasury, and congress enacted a law providing for such coinage of silver dollars, but the president, thrusting aside the action of congress, interposed his veto, and that source of relief disappeared. There are those who have clamored for sweeping reforms in tariff legislation proposing to relieve the people of intolerable burdens of taxation, but the party in power wrangles and factionizes until all hope of relief in that direction disappears. Meanwhile the country suffers, and labor more than any

other interest. Nothing can be hoped for from legislation, but during this period of suspense and uncertainty, confidence in the future is semi-paralyzed and the day of relief postponed.

Under such circumstances and in such conditions what can labor do? Can labor set industrial enterprises in operation? Can labor, even if organized, obtain fair wages per day? Is not labor so conditioned, as a general proposition, that it must accept reduced wages or remain idle? Would a strike improve conditions? Such is the character of the questions with which labor is called upon to wrestle. If any one has prudent advice to give, the present is a time when it will be patiently considered.

As we write, a case under our observation occurs. Carpenters demand 30 cents an hour. Contractors will pay 25 cents an hour. Carpenters refuse. Contractors remain firm. Pending the controversy nine houses which were to be constructed are abandoned and a contract to build a \$150,000 block is in peril. Meanwhile carpenters are idle. Contractors refuse to consult unions and contract with individuals. Such are the facts disclosed. Conditions are abnormal. Labor leaders now have an opportunity to speak. What will they say? As the English say, Hear! hear!

#### THE UNION PACIFIC AND THE UNITED STATES.

There exists a certain class of writers and talkers whose business appears to be the defense of railroad corporations and managers at all times and under all circumstances, and they are never more impudent and blatant than when railroad employees protest against the outrages perpetrated by these corporation officials. It is a well known fact because it is an officially recorded fact, that the interstate commerce law had its origin in charges of outrages perpetrated by railroad corporations so enormous and so flagrant as to cause a universal protest and a demand for remedial legislation. It is not required that we should recite these indictments; they are known and read of all men, and include almost every form of duplicity and fraud known to our Christian civilization. Not only was congress

called upon to arrest the deluge of rascality but state legislatures were implored to interpose and check, if possible, the rapacity of railroad corporations. And now we have authentic advice from Washington giving an outline of legislation to be enacted to punish the officials of the Union Pacific for a series of outrages perpetrated by them to defraud the United States government. The charges are of the most serious character and exhibit a degree of lawlessness which it is difficult to contemplate with composure.

The joint resolution submitted to congress by Representative Boatner, of Louisiana, in its recital specifies numerous violations of law for the purpose of defrauding the government, such as "an attempted consolidation with the Kansas Pacific railroad and the Denver Pacific railroad and issued stock of the Union Pacific on this consolidation for \$14,000,000. It is charged that afterwards further stock amounting to \$10,000,000 was issued for the alleged purpose of making repairs, etc.; that the purchase of the two railroads by the Union Pacific was made by the directors, who were themselves stockholders in the Kansas Pacific and the Denver Pacific, while the president of the Union Pacific was at the time president of the Kansas Pacific; that dividends have been voted in violation of the acts of 1873 and 1878, not out of actual earnings and while the Union Pacific was still in default to the United States. These payments from 1873 to 1884 are stated to have been \$27,000,000." Specifications further recite that the directors of the Union Pacific paid "the interest on the first mortgage bonds of the Oregon Short Line Railroad Company, amounting to \$4,000,000; that the directors in violation of the law and their official duties, paid subsidies to the Pacific Mail Steamship Company amounting to about \$1,400,000." The resolution arraigns the directors of the Union Pacific for numerous malfeasances, the purpose of which was to commit fraud and which were successful to a degree that demands prompt action on the part of congress to protect the interests of the government, and the charge is specifically made that the directors of the Union Pacific

"misappropriated and misapplied the property and funds" of the road, or in other words, embezzled and stole money which belonged to the United States, and that they should be compelled to restore the stolen property.

Let it be remembered, in this connection, that the men who are arraigned by congress for fraudulent practices, mean duplicity, corruption and business rottenness, are the men who, with the aid of United States judges, seek to make the employees of the road pay the penalties of their rascality. Is it to be presumed that such a gang of railroad wreckers as have had charge of the Union Pacific, and who have for years schemed to defraud the government and pocket the proceeds of their knavery, would hesitate to offer a United States judge, or any other judge, a bribe to aid them in their bunco business? And is it not infamously apparent that their hooks and traps have been successfully baited? Is it not visible to the naked eye that directors, receivers and judges are moral lepers, as unclean as the inmates of pest houses? When such monstrosities are clothed with power to impoverish workingmen, what remains of life worth the living? When by virtue of law, wrongs are perpetrated and workingmen defrauded, hopes of redress may be entertained, because the law may be repealed or amended; but in cases where there is no law, when a United States judge, in the arrogance of absolutism, robs workingmen of wages and ties them to a machine, sentences them to hard labor, and fines and imprisons them for "contempt," what is there left of our boasted liberty and citizen sovereignty? In old abolition times, when the country was "half free and half slave," men pointed to the "star spangled banner" and shouted, "Haul down that flaunting lie;" but no slave owner in all of the "sunny south" treated a "nigger" more contemptuously than the Jenkinses treat railroad employees. These ermined autocrats, these caesars, sultans and shahs, don't care for law, though they are created by law, the theory being that they constitute a department of the government and are not amenable to law. And the query has gone the rounds of the

press, "What are you going to do about it?" a sneering equivalent of Vanderbilt's exclamation, "The public be d—d." The idea seems to prevail that United States judges are the pliant tools of corporations, whose supreme duty it is at the bidding of their masters to reduce workingmen to the condition of the dog under the wagon. To what extent railroad employes will play dog or dogs at the behest of ermined autocrats, is as yet an unsolved problem, but we surmise it will be well for the peace of the country if courts are cautioned to be a little more careful in issuing their decrees. As yet the United States is not Poland, nor yet Ireland, though when a United States judge decrees that sovereign citizens shall not consult together about wages and welfare, under penalty of fine and imprisonment, Russia, Turkey, Persia, Ireland and Poland and every other country where men's rights have been cloven down, and men are slaves, march in procession, bearing testimony of this degradation autocrats have secured for the masses, and the world looks on and sees the United States take its place at the tail end of the train.

Corporations, directors and managers, as in the case of the Union Pacific and the Northern Pacific and other great systems of railroads, bring about wreck and ruin. Then a United States judge is appealed to, to strike down the rights of workingmen, and dire penalties are threatened if the decree is disobeyed. Thus, step by step, men are degraded and all too often accept their disgrace without protest.

But not all of them tamely submit. A readjustment is coming. We want it to come by righteous processes. We want it to come by the peaceful though often rugged roads of justice. We want it to come by the administration of honest laws, by unbribed, undebauched and unimpeachable courts. We want it to come by the ballot, by legislation designed to promote the welfare of the nation, but come it will. It is coming. Men who are not deaf hear the cries of a thousand Johns in the wilderness to make straight paths for labor's emancipation from the decrees of purchased judges, from the tortures of scheme created poverty and wretchedness,

from the curse of class legislation. It were folly to fix a day for the readjustment. There will be signs, and we have them; there will be wonders, and we are having them; there will be portents, they are seen in all directions. The hope of all good men is that the readjustments may come as the sunshine and the shower come to make the earth beautiful and fruitful of blessings, but come they will, and men at the helm of the ship of state will be wise if they study the signs of the times.

#### THE RIGHT SORT OF TALK.

The *Boston Labor Leader* in a recent issue contains the following caption, "The limit of state duties:"

In his Faneuil Hall address last week, Mr. Morrison Swift used these words, "We propose to take away the property of the rich—by law."

In this proposition we have the essence of the distinction between the purposes of organized labor and of those for whom Mr. Swift speaks.

The legitimate labor movement proposes to do nothing of the kind.

It purposes to so modify, either by repeal or enactment, the law so that men shall have equality of opportunity to reap the full measure of the consequences of their own conduct.

It does not accept the communistic proposition that property shall be taken, without equivalent, to be divided among those who have none.

It recognizes that the law of equity is distinct from the theory of equality, and that the attempt to supplant the individual virtues of industry, thrift and prudence by state action and a viva voce vote is as unjust in conception as it is impracticable in execution.

The theoretical gentlemen who are fond of implying that it is the duty of the state to make everyone rich and happy, may well remember that the famous Bill of Rights guarantees to the citizenship the power to "acquire and possess" property.

The dangers from Mr. Swift's theories and those of his school are not so much to the property holders of the state as to the working classes, upon which they will inevitably react.

There is, however, an advantage to be gained from the discussion he has stirred up, that a much-needed education may be obtained by citizens in all classes upon the proper limits of the duties of the state.

It should be distinctly understood by the legislators of this commonwealth that organized labor, however much it may be in sympathy, as it needs must be from the large quota of its own members embraced by them with the unemployed, is not in accord with the extreme utterances of Mr. Swift as to what the state may properly be called upon to do.

As Herbert Spencer has pointed out, the state is not a manufacture, but a growth, its "vast and complex organization . . . resulted from the voluntary co-operation of men pursuing their private ends."

Organized labor may and does demand that the in-

dividual freedom of the citizen shall not be invaded by other citizens, that the wage-earner shall not be put in a position of inequality and lack of opportunity by reason of state interference in behalf of others. Given even justice before the law, we fancy that he is willing to "assume the consequences of his own conduct."

This is as Prof. Nichols said in his testimony, an entirely different thing from the responsibility of the state to feed and shelter those who can not do this for themselves, and this responsibility is fully accepted by all humanitarians.

The foregoing from the *Labor Leader* brings to the front several questions which, with more or less directness, people are debating in the press and on the rostrum.

In every direction scenes are witnessed in which the unemployed are demanding of local governments employment, or, in the absence of employment, subsistence—food and fuel, and occasionally, with an emphasis, if demands are not heeded, which means trouble for the government. Necessarily, such demands force into prominence the question, What has municipal government, state government, or even the federal or general government, got to do with furnishing the unemployed with employment—work and wages? We answer, nothing at all; the governments to which we have referred, have one, and only one means for obtaining money, and that is by taxation. These governments operate under charters or constitutions, having no powers whatever, except such as are conferred by such organic, or fundamental laws—and here it should be remarked, because it is a fundamental fact, that no where does charter or constitution confer the right on the governments named, to tax the people to raise money to support the unemployed. There is, in other words, no paternalism in American government—neither municipal, state nor federal.

Take for instance the 5,000 men who invaded the state house of Massachusetts, demanding of the legislature employment. The state could only reply that it had no employment for them—and when the demand was made for subsistence, the state could only reply, that it had no money with which to purchase food for the hungry—and what was true of the government of the state of Massachusetts, was equally true of the government of the city of Bos-

ton—and these governmental conditions and restrictions apply with equal force to all the states and cities of the country.

To change this policy, it would be necessary for the government to levy an *employment tax*, specially designed for the benefit of the unemployed. As a matter of course, before such a tax could be levied constitutions and charters would have to be so amended as to permit cities and states to enter upon a system of improvements designed, specially, to give work and wages to the unemployed. Such amendments to organic laws could never be enacted, or if they were, and laws were passed to give them effect, cities and states would be bankrupted in five years. The flood gates of speculation, speculation and fraud would be swung wide open and ruin would result.

Notwithstanding all this, the demand for employment by the unemployed has repeatedly been made upon municipal and state governments during the past year, and fearing the consequences of denials, concessions have been made, and work, prospectively required, has been supplied, the benevolent purpose being, to bridge over, if possible, the fearful conditions which have confronted multiplied thousands of wage earners, and that too by no fault of their own.

To go still deeper in the analysis of the problem, the fact is developed, that unless the idle find work, and obtain wages whereby the necessities of subsistence can be had, the scenes of the past year are likely to be re-enacted upon a larger scale. The idea is abroad and it is taking on a more fully developed shape, that the government is bound, in some mysterious way, to give the unemployed work or provide for their pressing wants, and the idea is securing a deeper hold upon thousands of the people. It were folly to ignore it. The language of Mr. Swift, quoted by the *Labor Leader*—"We propose to take away the property of the rich by law," is putting it mildly. The men who propose to take away property from anyone by law—which we suppose means confiscation, are ripening for taking property by the most speedy means that can be suggested. Such froth amounts to little where normal conditions

exist, but where thousands are hungry, ragged and cold—laws are ignored—because it is said that “hunger knows no law”—it does not reason—and as the pangs of hunger tear and rend the vitals, men become maniacs—and results, always the same, are appalling.

Contemplating the outlook, we are forced to the conclusion that the nation's labor troubles are the joint product of the two great political parties which, for years have controlled the destinies of the country. In this fact lies the danger. If congressional legislation has wrought the ruin which confronts the country on all sides, is there one hope left, to spring eternal in the human breast, that either of the parties which conjointly have wrecked the industries of the country, can inaugurate prosperity? The question is up for debate, and it is one in which wage earners are profoundly interested.

#### THE STRONGEST SENTENCE IN JUDGE CALDWELL'S OMAHA DECISION.

Mr. E. C. Snyder, of the Chicago *Herald*, recently interviewed Judge Caldwell at Omaha. In the interview we find the following:

Then the reporter asked him to write what he regarded as one of the strongest sentences in his recent decision. Taking up the pen which had been discarded for a moment he wrote this utterance, which is destined to become memorable:

A corporation is organized capital; it is capital consisting of money and property. Organized labor is organized capital; it is capital consisting of brains and muscle. What it is lawful for one to do it is lawful for the other to do. If it is lawful for the stockholders and officers of a corporation to associate and confer together for the purpose of reducing the wages of its employees or of devising other means of making their investments profitable, it is equally lawful for organized labor to associate, consult and confer with a view to maintain or increase wages. Both act from the prompting of enlightened selfishness and the action of both is lawful when no illegal or criminal means are used or threatened.

The announcement that labor has a right to organize to obtain and maintain fair wages, is not new. It has been stated and conceded long prior to the wrecking of the Union Pacific.

There is something about the sentence which Judge Caldwell thinks the “strongest” in his decision, which we do not com-

mend. The expression “enlightened selfishness,” has a bad ring and an offensive odor. Strictly speaking, there can be no such thing as “enlightened selfishness. Besides the motives which prompt labor to organize, and those which incline capitalists to combine, are so widely different as to bear little, if any, resemblance. When labor organizes to secure better wages and succeeds society is benefited, the gain does not all accrue to labor, to the few, but is widely distributed. The homes of the masses, the nurseries of patriotism, liberty and independence, feel the vitalizing influences resulting from any advance in wages, the effect being, in all regards, of the most gratifying character. Manifestly, there is in such a policy that which bears the stamp of enlightenment. No search light is sufficiently luminous to enable the investigator to find in it a well grounded objection. But is it “selfishness?” Is there anything connected with it against which conscience can formulate an objection? Selfishness is declared to be a “vice utterly at variance with the happiness of him who harbors it,” hence, “enlightened selfishness,” becomes enlightened vice. Judge Caldwell doubtless stated the law, when he said: “It is lawful for the stockholders and officers of a corporation to associate and confer together for the purpose of reducing the wages of its employees,” but to say that such a course is “enlightened selfishness,” is, to put it mildly, a rare exhibition of incoherency. If the eminent jurist had said, that when stockholders and officers confer for the purpose of reducing wages, they exhibit sordid selfishness, he would have stated the exact fact, but any intimation that the selfishness of corporations, expressed in the reduction of wages, bears the stamp of enlightenment, that conscience is in any way involved, that it is anything more or less than mean contemptible avarice, does violence to language and words cease to be the signs of all ideas of honesty.

There is not in the records of the human family anything more commendable, more enlightened, more strictly in consonance with the well being of society at large, than the organization of wage earners to secure for themselves and for the good of those

dependent upon them, an equitable share of the wealth they create; nor has there ever been a more villainous exhibition of man's inhumanity to man, than the association of capitalists, under any of the thousand corporate names they have chosen, to reduce wages and degrade the wage earner. And yet, as Judge Caldwell remarks, such associations having in view such atrocious purposes, are lawful, equally lawful with associations which have in view purposes worthy of the highest commendation. In the Union Pacific case these distinctions were brought to the attention of Judge Caldwell, and he passed upon them. He saw, on the one hand, the sight of a large number of men included in various labor organizations, foully dealt with by an organization of capitalists. He saw that the capitalists were animated by a purpose of robbery which he unfortunately calls "enlightened selfishness," enlightened piracy, and in righting the monstrous iniquity, he puts this sentence in his decision:

The court shares in their anxiety to have an economical administration of this trust to the end that those that own the property and have liens upon it may get out of it what is fairly their due. But to accomplish this desirable result the wages of the men must not be reduced below a reasonable and just compensation for their services. They must be paid fair wages, though no dividends are paid on the stock and no interest paid on the bonds. It is a part of the public history of the country, of which the court will take judicial notice, that for the first \$35,000,000 of stock issued this company received less than 2 cents on the dollar, and the profit of construction, represented by outstanding bonds, was \$43,929,328.34.

We choose to think the foregoing is the "strongest sentence" in Judge Caldwell's Union Pacific decision. It goes deeper, has a wider spread, and reaches higher than any other sentence in his justly famous decision. It is an announcement for the first time made by any judge, state or federal, that the courts would not protect organizations of capitalists in carrying out their "enlightened selfishness," to rob workingmen to pay interest and dividends on villainous frauds, but that the court would protect the organizations of workingmen in obtaining and maintaining fair wages, an enlightened policy, seeking the welfare, not only of wage men, but the good of society

at large. The difference is as the difference between daylight and darkness, right and wrong, truth and error, and this difference Judge Caldwell saw, and pointed out so clearly as to win universal applause.

#### DUNDY VS. CALDWELL.

The Omaha *World-Herald*, of recent date, contains a full account of Judge Dundy's explanation of his order, or *permission*, relating to the cut in the wages of the Union Pacific employes by the receivers. The proceeding, as Judge Caldwell pointed out, was in all regards tyrannical and unjust. The receivers violated contracts, changed schedules, ignored organizations, were deaf to petitions and remonstrances, and being iron shod, trampled contracts and schedules into the dust, and being backed by the court, thought their scheme to pocket many thousands of dollars of workingmen's wages every month perfect, and chuckled as they contemplated the sum total of their robberies. But the fabled bull in the china shop did not create greater consternation than did Judge Caldwell when he upset their plans.

There are some features of the Union Pacific imbroglio of remarkable significance, as for instance, Judge Caldwell heard and determined the cases of certain employees, included in organizations represented in his court by their Grand Chiefs and attorneys, while employees who were not thus represented were left out in the cold, to endure, as best they might, the wrongs inflicted by the receivers in reducing their wages. It is probably true that under ordinary practice Judge Caldwell could hear and determine such cases only as were brought to his notice in regular form, and yet, it seems strange that in righting grievous wrongs he did not throw the protecting arms of the court around all the suffering victims of the receiver's tyrannical policy. This he did not do, and as a consequence, these ostracized employees appealed to Judge Dundy, and whatever may be said of his previous action in responding to the petition of these neglected and wronged men he expanded to the full stature of an upright Judge. It goes without saying, that the action of Judge Caldwell created a splendid

opening for all concerned to deal justly by the employes of the road, regardless of organization, but it so happened that a vast number of the men who were unrepresented in the cases Judge Caldwell determined had been organized under the banner of the American Railway Union and were represented in Judge Dundy's court, and that Judge Dundy, regardless of any former action, decided to hear these men, and to deal justly by them. Nor is this all—the receivers, themselves, having received a revelation from Judge Caldwell, came into court with a petition, demanding justice for the men, all classes of employes, the same measure of relief that Judge Caldwell had extended to the various organizations he had heard. We think it difficult to exaggerate the revolution wrought in these regards on the Union Pacific. It reads like fiction rather than stubborn fact, and that our readers may have the story in full we reproduce the petition of the receivers to the court, as follows:

*To the Honorable Judge of the Circuit Court of the United States:*

Your petitioners, the receivers, herewith, now come and say: They submit to your honors that it is not incumbent upon them herein to answer the intervening petition of the American Railway Union in this case, for the reason, as they represent and show to your honors, that no such organization had ever been so far organized or in existence on the Union Pacific system prior to the receivership or to have had any negotiations or arrangements with the managing officials of said railway system with respect to the rules, regulations and schedules governing the employment or pay of employes, or with respect to any other matters affecting the administration of the affairs of the Union Pacific system. But your receivers are willing to meet in or out of court any duly constituted representatives of any class of the employes of the Union Pacific system, and to adjust with them the matter of fair and reasonable wages for services performed. Your petitioners respectfully show to your honors that at a meeting of the receivers held in New York, on April 9, 1894, the following preamble and resolutions were adopted:

WHEREAS, The United States circuit court of Nebraska has decided that the schedules of pay, and the rules and regulations which were in force upon the said Union Pacific system at the date when the property of said system passed into the custody of the receivers be in full force and effect by said receivers; and

WHEREAS, The Union Pacific Railway company, by order dated August 26, 1893, had directed certain reductions to be made in the salaries of a portion of the employes of the company, by which reduction those employes whose salaries have been reduced do

not, in the judgment of the receivers, receive just relative compensation when compared with the compensation of the employes affected by said order.

*Resolved*, That the general solicitor of the receivers be directed to present to the court this petition on behalf of the receivers, asking for authority to fix all salaries, so that from and after April 1, 1894, all employes of the receivers affected by the order of August 26, 1893, shall receive the same rates of pay which were in force before the order became effective.

*Resolved*, That the general solicitor be authorized to so draft said petition as to request authority for such advance in the wages of the trackmen, bridgemen, laborers, clerks, etc., and those classes of labor not included in Judge Caldwell's order whose pay was reduced by the officers of the Union Pacific Railway company during the few months just preceding the appointment of the receivers, as may seem to the general manager proper and just under the circumstances.

Your petitioners submit to your honor that the position taken by your receivers in and about the adoption of the foregoing resolutions was reasonable and proper and fully justified by the circumstances and the situation. They now represent and show to your honor that the pay of all classes of employes on the Union Pacific system prior to September, 1893, was relatively just and fair as between the several classes; and if there is no controlling reason growing out of the situation as heretofore presented by your receiver to this court why those classes of employes whose matters have recently been heard and adjusted should participate in any decrease of wages looking to a reduction of the expenses of operation of the properties of the Union Pacific system, it is manifestly unjust that those reductions which have cheerfully and without protest been submitted to by the unorganized employes of the Union Pacific system should be further continued.

Wherefore, your petitioners pray the order and direction of the court in the premises and suggest that your honor make an order herein, authorizing and empowering your receivers to relieve all the employes of the Union Pacific system from the effect of the percentage reduction of August 28, 1893, and further authorizing and empowering your receivers to readjust the wages of trackmen, bridgemen, clerks, sectionmen, laborers and all other employes whose pay was reduced by the officers of the Union Pacific system.

The foregoing is a remarkable document. Never, since railroad wrecking was reduced to a science, and progress and poverty, hand in hand, began their march from Plymouth Rock to the Golden Gate, has any thing bearing the slightest resemblance to it appeared in print, bearing the plutocratic stamp. It not only recognizes the American Railway Union, but all the employes on the system, organized and unorganized—a petition from the men who cut wages as pirates cut throats, to restore wages as they were before they were reduced.

It is not required that the MAGAZINE should indulge in any criticisms relating to any disagreements between Judges Caldwell and Dundy, except to say that the employees of the Union Pacific have been immensely the gainers. We know little of court courtesy, and care for it even less than we know, our interest centering in the fact that Judge Caldwell enunciated great truths based upon fundamental principles, and that his decision made it possible for Judge Dundy to restore wages to all the wronged men on the Union Pacific, which he has done, and that as a result peace reigns throughout the system between court, receiver and employees. The universal verdict is that the cut in the wages on the U. P. R. was a grievous wrong, and that the action of Judges Caldwell and Dundy in righting the wrong not only reflects the highest credit upon these gentlemen, but is a victory for labor of incalculable importance.

#### MAN.

"What is man that thou art mindful of him?"

"Strange how a harp of so many strings  
Should keep in tune so long."

Those who have studied man, physically, admit that he is "fearfully and wonderfully made," and this conclusion is supported by the facts disclosed when his physical organism is subjected to dissection.

The *Popular Science Monthly* emphasizes the fact that man need not wander the wide world around for opportunities to investigate the curious and wonderful works of Omnipotent wisdom, but may, if they are seeking for the marvelous, find in the examination of themselves such wonderful things as will satisfy much of their ambition.

Now, it is very interesting to know that in a perfect human body there are about 263 bones, constituting the frame work for about 500 muscles. In the item of bones, all men are born equal, and the same is true of muscles, but it should be stated, as a general fact, that the bones and muscles of a workman are superior to those of a millionaire, being better developed, and therefore of greater service to the world.

The alimentary canal, by which nourish-

ments are conveyed through the body, is about 32 feet in length, and any derangement of its functions places health, and life itself in peril. No canal in the world, however vast in its dimensions or cost, is to be thought of for a moment in comparison with the alimentary canal that every man bears about in his body, and about which not one man in a thousand has ever given a moment's study.

Taking 150 pounds as the average weight of a human body, one-fifth of the weight, or 30 pounds, is blood, and the duty of the heart is to distribute this blood throughout the body. The heart is 6 inches in length and 4 inches in diameter, and beats 70 times per minute, 4,200 times per hour, 100,800 times per day, 36,792,000 times per year, 2,565,440,000 in three score and ten, and at each beat  $2\frac{1}{2}$  ounces of blood are thrown out of it, 175 ounces per minute, 656 pounds per hour,  $7\frac{3}{4}$  tons per day. All the blood in the body passes through the heart in 3 minutes. This little organ, by its ceaseless industry, pumps each day what is equal to lifting 122 tons 1 foot high, or 1 ton 122 feet high. Considering the vast amount of hard work which the heart is required to perform, it is not surprising that "heart failure" is so frequently referred to as the immediate cause of death. Necessarily, when the heart ceases to pump and distribute the blood, a man dies, but to assign the responsibility to "heart failure," as frequently as it is done, is pronounced by the highest medical authority as incorrect and misleading, and yet, it is true, that as a machine, the heart is frequently overtasked to an extent that, independent of disease, it can no longer perform its duty, in which case death ensues from heart failure.

In the matter of breathing, it is stated the lungs contain about one gallon of air at their usual degree of inflation, and that a man breathes on an average 1,200 times per hour, inhales 600 gallons of air, or 24,000 per day. The aggregate surface of the air cells of the lungs exceeds 20,000 square inches, an area nearly equal to the floor of a room 12 feet square.

Such facts deepen the impression that a man is fearfully and wonderfully made, and

that as a harp of many strings it is still more wonderful that it does not more frequently get out of tune and require repairing.

Referring to the brain and nerves of a man, it is said that the average weight of the brain of an adult male is 3 pounds and 8 ounces; of a female, 2 pounds and 4 ounces. The nerves are all connected with it, directly or by the spinal marrow. These nerves, together with their branches and minute ramifications, probably exceed 10,000,000 in number, forming a "body guard" outnumbering by far the greatest army ever marshaled. It is exceedingly difficult to grasp the ramifications of such a machine as scientific investigation proclaims man to be. To weigh the brain and count the nerves connected with it, or to approximate the number, is no small undertaking, but when the powers and capacities of the brain are considered, all laws of calculation are useless—as well try to fathom the attributes of God Himself, or find the boundaries of the universe.

In the further consideration of man we are told that the skin is composed of three layers, and varies from one-fourth to one-eighth of an inch in thickness. The atmospheric pressure being about 14 pounds to the square inch; a person of medium size is subjected to a pressure of 40,000 pounds. Each square inch of skin contains 3,500 sweating tubes, or perspiratory pores, each of which may be likened to a little drain pipe one fourth of an inch long, making an aggregate length of the entire surface of the body of 201,166 feet, or a tile ditch for draining the body almost forty miles long.

In writing of man, from bones to skin, we are ready to exclaim with the Psalm writer, "What is man that thou art mindful of him?" And in answer, it might be said, that man is the Creator's *chef d'œuvre*, His masterpiece, His grandest creation. Hence, as "God is no respecter of persons," but awards to all equal consideration, the fact that one class of men assume authority to impoverish and degrade another class of men, must of necessity be esteemed in the courts of heaven as treason to the Creator's government. Nor do we doubt that it was

owing to such treason that made the Creator "repent" that he had made man, and paved the way to the decree that He would destroy man from the face of the earth. Admitting that God is still mindful of men, we do not hesitate to believe He is well pleased when He sees organized workingmen battling for their rights against the machinations of plutocratic pirates, whose ambition is to rob them—to make life scarcely worth the living—to make liberty a sham and the pursuit of happiness as fruitless as looking for a needle in a haystack.

#### MEDICAL SCIENCE

It has been held by eminent men of a particular school of medical jurisprudence, that in the vegetable kingdom there is to be found a remedy for all the physical ills which fall to the lot of man's mortal body. And among all nations, savage and civilized, the hunt for such remedies has been continued since sickness and death invaded the world. But in spite of all explorations of the herbs of all the hills, valleys and mountains, people continue to get sick and die; the provision being a wise one we think, else starvation would do the work that is now left to less violent and sweeping misfortunes. Nevertheless, science never tires in its investigations and the vegetable kingdom continues to yield up its secrets for the relief of human infirmities.

Medical science, however, does not confine its investigations to vegetation. It explores the mineral kingdom for remedies and proclaims that it has found them. Nor does this suffice, but the explorations overleap all boundaries to find remedies for human ills, until the insect world is invaded to find panaceas and specifics for disease.

Once in a while some student makes a clean breast of it, goes into particulars and informs us that, in addition to Spanish flies, potato bugs are equally blistering when applied to the human cuticle, and that the United States alone has no less than fifteen known species of blistering beetles; and to soothe those who are afflicted with kidney troubles, it is stated that cockroaches, dried and powdered, are recognized by the medical fraternity as a remedy for dropsy.

Now then, we take it, not the cockroach,

but the announcement that the discovery having been made that the cockroach is valuable as a medicine for the afflicted, the insect will be more favorably regarded by the people. We have no idea what cockroaches are worth by the pound, by the thousand, or by the bushel, but if the prices are such as to yield moderate profits and the demand warrants large investments, a cockroach trust might be organized by Rockefeller and some other millionaires, which, with an inexhaustible supply of roaches, would net immense dividends.

A cockroach millionaire might not sound quite up to the standard of New York's "400," but Ward McAllister would soon discover a way to reconcile matters. The enterprise might be known as the "cockroachefeller trust," or the "kidneyan corporation," in which case stock could be watered *ad infinitum*, or if Ward wanted to knock out everything plebeian and verminous, he could call it "*Blatta Orientalis*," when the cockroachers would be admitted to banquet and ball. The cockroachers when organized might extend their operations to the collection of potato bugs, until all hands became gold bugs with which to blister the world; in fact, they might collect the American blistering beetles and knock the Spanish fly out of the markets. It would be a most interesting feature in business circles to read the quotations of cockroaches, potato bugs and beetles on 'change, as also the quotations of the stocks and bonds of the insect syndicate.

Manifestly, the discovery that cockroaches, potato bugs and beetles possess medicinal qualities, may be the basis of great industrial operations in the near future. Trapping cockroaches and beetles, and gathering potato bugs in their season, suggest large possibilities for the employment of women and children, and the inventive Yankee who first throws upon the market a cockroach trap that meets the requirements, will find himself suddenly a social lion. Quite likely Mr. Edward Atkinson could invent such a trap, and thus add fresh luster to his fame, secured by the Aladdin oven invention and to the discovery that a square meal for a workingman can be secured for three cents.

### CRIME IN PRUSSIA.

Advices from Berlin of late date report that Berlin and the provinces are experiencing an "avalanche of crime of the most atrocious character—such as murder, robbery, assaults on women and children, on officials and employers." In this there is nothing strange or novel. On the contrary, it is as natural as cause and effect. It may be phenomenal, but it conforms to the laws which govern such cases, laws as certain in their operation as the laws of gravitation and attraction.

It appears, however, that the Kaiser has become much concerned, if not alarmed, by the seriousness of the reports relating to the frequency and the enormity of the crimes committed—and he has caused a letter to be written and circulated among judges, high police officials, teachers and doctors of law, for the purpose of ascertaining the cause of the deluge of crime now prevailing in his kingdom. The questions are as follows:

Are the youthful criminals more deserving of the attention of physicians or of the criminal law?

If this be the case, what counsel have you to offer in the premises?

How can the influence of family life be directed toward an abridgement of the evil?

Has woman and child labor in factories a bad influence on the growing generation, such as to foster crime?

How about the schools? Do you think teachers lay too much stress on the cultivation of the mind while neglecting the cultivation of the heart and soul?

The Kaiser, it is seen, does not ask questions designed directly, if honestly answered, to make him responsible for a large per cent. of the crimes about which he appears to be so much concerned.

Suppose he had asked, "Are youthful criminals of a class that are well fed, clothed and sheltered? What *per cent.* of their crimes can be traced to poverty, squalor and degradation? Is taxation, to maintain royalty, a standing army and other outrages upon decency and common sense, in any way responsible for the "avalanche of crimes" in Berlin and the provinces? Is not the taxation, levied upon my subjects, in itself a huge crime, and the prolific parent of most of the crimes committed in my kingdom?

His subjects, the socialists, would have

promptly responded in a way that would have made his diamond bespangled crown set very uneasy on his head. The Kaiser turns his attention to the "family life" of his subjects, his cattle, and would know what its influences are upon children. If he were not as blind as a bat he would know that extreme poverty, low wages, bad and insufficient food, create conditions in which criminals are developed, not only in Germany but everywhere, in all civilized lands. Then he inquires about the effect of woman and child labor in factories, when he ought to know that such labor is debasing and must, eventually, where it is permitted, be productive of degeneracy, and then this royal individual refers to schools and the influence they exert upon "heart and soul," and doubtless wonders that the poor, who are half fed, half clothed, and sheltered less expensively than beasts of burden, are not made to appear like angels.

All that is required anywhere to produce "avalanches of crime" is for the rich to proceed with their robberies. Degradation will follow, penitentiaries will be crowded, not only in Germany but in this "God favored" land, known as the United States."

#### THE GRAND MASTER VINDICATED.

In the following report of the Grand Executive Board and the Board of Grand Trustees of the Brotherhood of Locomotive Firemen will be found a triumphant vindication of Grand Master F. P. Sargent, in reference to all his official acts since the close of the last convention. It appears that Bro. Sargent has been not only harshly criticised, but that he has been the subject of slander and vilification to an extent that made it necessary to convene the boards above named for the purpose of instituting an investigation in justice to Bro. Sargent as well as the order at large. We have happened to see or hear but a small part of the alleged vituperation which is so fiercely resented, and our own idea is that investigating slanders is a waste of time. The easiest way to kill a slander is to ignore it. We speak from experience. Still, the results of the investigation here recorded are exceedingly gratifying to Bro. Sargent and his many friends as well as the order at large.

It is shown that in all his official conduct Bro. Sargent acted with a prudent regard for the welfare of the order, and no blame attaches to him as Grand Master for any act of omission or commission in connection with his high office. The report also

shows the brotherhood to be in a prosperous condition, which will be gratifying to every member of the order.

The full text of the report is as follows:

TERRE HAUTE, IND., May 12, 1894.

*To the Public:*

We, the members of the Grand Executive Board and the Board of Grand Trustees of the Brotherhood of Locomotive Firemen, having concluded our deliberations, are now prepared to submit the following statement:

We were called together by Grand Master Sargent for the express purpose of inquiring into his official acts and to investigate his management of the Toledo, Ann Arbor & North Michigan strike, the Lehigh Valley strike, the Louisville & Nashville, the Chicago & Eastern Illinois and Great Northern troubles. Also to inquire into the manner in which the Protective Fund has been handled.

We have exhaustively reviewed each separate case, from the incipency of the trouble on the Ann Arbor to the recent disturbance on the Great Northern, and in no single instance can we find where Grand Master Sargent has done wrong. His judgment has been sound, his acts wise and his utterances reasonable, conservative and in perfect consonance with the policy, laws and established customs of the Brotherhood of Locomotive Firemen. He has honestly, conscientiously and fearlessly performed his duty, and we heartily endorse his official acts and utterances.

The Custodian of the Protective Fund has accounted for and paid over to the Grand Secretary and Treasurer every dollar of principal and interest. It was paid out in accordance with the laws of the order to the firemen engaged in strikes on the Ann Arbor and Lehigh Valley railroads. Not a dollar was misapplied, and the records in the grand lodge office show to the minutest detail how it was expended.

The Custodian of the Protective Fund, Wm. F. Hynes, is deserving of special credit for the way in which he fulfilled the trust reposed in him. So conservative has been his management that he would not deposit a cent of it in even the strongest banks without a personal guarantee from responsible men outside the security of the bank. Through this precaution the funds were entirely safe during all the financial storm of last summer and not a cent was at any time in danger. It was promptly furnished when called for to pay striking firemen on the Ann Arbor and Lehigh Valley Railroads.

The brotherhood is in a prosperous condition, considering the general depression and consequent shrinkage in railroad traffic. Despite the fact that hundreds of fire-

men are out of employment and the earnings of the majority of those employed have been less, because of less traffic, the order has faithfully discharged its every obligation.

At the present time we have 519 lodges, with a total membership of 28,166. From August 1st, '93 to May 6th, '94, 16 lodges were organized. From Aug. 1st, '92 to date \$826,250 has been paid on death and disability claims. In the same period \$99,425.59 has been paid from the protective fund.

For the past eighteen months a vigorous propaganda of vilification, innuendo, slurs and slanders has been maintained and directed with malignant purpose against our order and its grand officers. The batteries of the falsifier have been trained on us with the set intent, doubtless, of disrupting our organization. Every mean, low, sneaking method which perverted ingenuity could devise has been resorted to to excite suspicion in the minds of the rank and file of our membership and shake their loyalty to and trust in the order. In this our enemies have a two-fold purpose, to accelerate our dissolution by disheartening the rank and file and to so disgust our grand officers that they will retire from the positions they hold.

We denounce as unmitigated falsehoods the fugitive items of news floating through the press of the country about the shaky condition of our order and the corruption of our grand officers.

We caution our members against the insidious approaches of those who are engaged in a reprehensible effort to belittle and disrupt the brotherhood, and urge upon them the expediency of remaining true to the order and its officers, who have been so true to them.

### Compulsory Arbitration.

MR. EDITOR:—Upon the question of compulsory arbitration we are called to express approval or disapproval; and upon such expression, by the membership of the various railway organizations, will depend, no doubt, an effort to amend the present act creating boards of arbitration. As the act to be amended is a national law, and deals only with those parties engaged in inter-state commerce, it is evident that it is a question of considerable importance. As a national law which, in its present form is more ornamental than useful, it will undoubtedly remain unchanged until con-

gress is petitioned to amend it by introducing the principles of coercion. If we will have the courage to be honest and frank, we shall have to admit that it is a question upon which we are hardly competent to form an opinion. We are not aware that it has been profoundly considered, widely discussed, or extensively tried; therefore our conclusions will be narrow and conjectural. It is safe to assume however, that when congress passed the act creating boards of arbitrations or commissions, their intention was to protect the public interest rather than the rights and interests of the individual. I doubt if they had any desire to interpose any barrier to the absolute control of the internal affairs of railroads by the railroad managers. However this may be, our position relative to the question of compulsory arbitration is such that we should eliminate from the question all public considerations, and deal with it only as we may conceive it to affect the rights and interest of the railway employes. As the law is at present, it does not abridge in any way, any natural or legal right of an individual; or of an association. Neither of a corporation. Neither does it invest the individual or corporation with any new rights. It simply prescribes the method to be adopted when a dispute or controversy between a railway and its employes, is of such a nature and intensity that the two parties interested are unable to agree, and they voluntarily conclude to submit it to arbitration. Under the provisions of this law, all parties between whom there may be a dispute or controversy, may exercise their own judgment and discretion as to whether they will submit to arbitration; and having submitted a matter to arbitration they are under no compulsion to accept the decision of the arbitrating board. As a means of conserving the public interest, or of promoting pacific relations between the railways and their employes, it has been a complete failure; and mainly for two reasons. First, because in most cases, sooner or later, the contending parties have been able to settle their disputes. Secondly, they have had no confidence in arbitration. Now what is proposed by the amendment to this act? We are told the intention is, to make it a compulsory law—a law which will coerce the two parties to submit their disputes to arbitration. But will the amendment as drafted accomplish this end? Let us see. Under the amended act, arbitration would depend upon the "written proposition" of one party to the other party of the dispute or controversy. Without such written proposition under the amended act, the law would be a nullity even as at present. And if there is no faith in arbitration, from whence shall the written

proposition spring? It may be assumed as a positive fact that the railway companies are opposed, and will exert a tremendous influence to any measure compelling them to arbitrate differences with their employees. It is evident therefore that the railroad managers would not be the party to submit the written proposition, without which there could be no arbitration. Now under these circumstances the only party upon whom can be placed a reliance to bring forth the "written proposition," must be the interested employees. But will they do it? I think the amendment carries the assumption that they will. But as they have had no faith in arbitration, it is doubtful if they become the prime movers in a scheme of coercion, as binding upon themselves as upon the other party. Even though they should have faith in arbitration, and should submit the "written proposition," so essential, the other party to the dispute is under no compulsion, unless the "differences or controversies have been accompanied by acts or threats to act in such manner as to hinder, impede, obstruct, interrupt or affect such transportation of property or persons." In other words the aggrieved employees must assume the attitude of strikers; and by acts or threats to act in such manner as to interfere with inter-state commerce, before the act becomes a compulsory law. Seeking to promote pacific relations between contending parties and to keep the channels of inter-state commerce unobstructed, it invites belligerency and hostility, and makes such acts a prerequisite to its interference and demonstration of its virtues. It seems to me that a law embodying such features as these falls far short of being a compulsory arbitration law; and that such features are grotesque absurdities; ineffectual makeshifts. It is a well established rule in arbitration that the "arbitrator ought to be a person who stands perfectly indifferent between the disputants." Is this rule recognized in the proposed amended laws? The fact that each of the contending parties "shall select and appoint one arbitrator, is a guaranty that the board will be a biased board, and one which will not stand perfectly indifferent between the disputants. It will not be contended for a moment that a railroad company or the employees in exercising the right to select and appoint an arbitrator, would not select and appoint a person who would be favorable to their respective interests. In granting the right to select the implication is established that the rights and interests of the respective parties will be well guarded. The very selection itself surrounds the arbitrators with obligations to the party to whom he owes his selection. But it will be said that there is a third arbitrator—one who

owes his selection to neither party; and therefore he stands perfectly indifferent between them, unbiased, unprejudiced, neutral. To this argument I would reply that the character, disposition and position of this third arbitrator would be most carefully scrutinized by the other two arbitrators who have the selection. I apprehend that a railroad manager, stock owner or legislator would be objectionable to the arbitrator representing the employees; while any and every man who had expressed an interest in the cause of labor would be objectionable to the arbitrator representing the company. But grant that the third arbitrator possessed the qualities of an ideal judge, would he be in a position to reconcile the opposing and conflicting interests which the other two must necessarily represent? If so then he would virtually be the sole arbitrator, and upon this one man would rest the responsibility of adjudicating the differences between those two mighty forces. Capital and labor, are you ready and willing to submit your rights, interests, nay! your very destinies to such a tribunal? If so, why not clamor for the eradication of jury trial. Do you believe for a moment that your interests as employees would be more faithfully and successfully guarded; that a greater degree of justice would be meted out to you; that your compensations would be more equitable; that your services would be less onerous, and that your treatment would be more as become men? If you do, you forget that in every dispute between antagonistic parties the settlement has been dissatisfactory to one or both of the parties, and that the decision has been accepted, not as a final settlement, but as a temporary adjustment, holding good only to such times as circumstances and conditions warrant and justify a renunciation. What has been the results of state boards of arbitration. In how many instances have they endeavored to justify the longings and aspirations of the struggling workman? in how many instances have they endeavored to protect the weak against the strong? in how many instances has their sense of justice been warped by the power and influence of brain and capital, when muscle and poverty have been pleading for mercy? Can you recall a single instance when a legal board of arbitration has been of any benefit to organized labor in its contests with railway corporations? In the Lehigh strike the boards of arbitration representing New York and New Jersey, interfered to bring order out of chaos; harmony out of discord; manhood out of serfs; justice out of tyranny. What was the result? A meaner subterfuge was never put forth. A more treacherous and diabolical scheme was never concocted than in this very case.

And yet those boards of arbitration congratulated themselves upon the termination of that strike and considered that their good offices had accomplished much towards that termination. But let us hasten along and glance at other features of arbitration. I find that where arbitration has been made compulsory, the awards of the arbitrating boards "operate as final and conclusive judgments respecting all the matter submitted, and it binds the rights of the parties for all time." This is the theory prevailing in England, where compulsory arbitration has been applied to railroads since 1845. The courts have recognized this theory, and have refused to set aside such awards unless it could be proven that they were the outcome of corruption and fraud! To adopt compulsory arbitration and recognize this theory, is to bind the modern to the mediæval; the mediæval to the ancient. The ancient Medes and Persians made their laws unchangeable and unalterable. An award, which is final and irrevocable, when applied in the settlement of controversies which arise as the result of ever changing, varying conditions, is worthy of the times of those intellectual pigmies and industrial paupers. Those who would submit an industrial controversy of 1894 to an adjudication which was to be final, co-existing with time, would ally themselves with the devotees of Filmer and the doctrine of passive obedience. They would be dead and insensible to that progressive spirit which animated Charles Sumner, when he said, "times change and all things with it; and he who has lived through a lapse of years untouched by these mutations has lived to little purpose."

The United States has established eight hours as a legal day's work; while many of the states have made ten hours the legal day. But with railroad companies they exact twelve hours. Time is computed by the day. Now suppose the employees on any system should petition their officials for a ten or eight hour day and they were unable to obtain concessions. The matter in dispute is referred to an arbitrating board whose decision is to be final in accordance with the theory of compulsory arbitration. Do you believe, for a moment, under present conditions—industrial stagnation, commercial paralysis, when operating expenses are being reduced to the lowest point in order that the receipts shall be equal to the expenditures, that the employees would be able to get any favors or concessions from an arbitrating board in the way of reduced hours? Would or could this matter under present conditions be settled for all time, and at the same time be an equitable or just award to either or both parties. Would not an

eight hour decision force a company into insolvency, providing the rate per day remained the same? If it did then what more or less than judicial confiscation of personal and corporate property would such an award be? Suppose the award was a twelve hour award, would it be a just award, and one which should govern for all time? May we not conceive that, under certain conditions, such a decision would amount to a confiscation of the employee's compensation. It seems to me that the principle underlying the national eight hour law is, the greater the wealth and ability of the employer, the higher the rates of compensation to the employee. For a reduction of hours without a reduction of rate, is equivalent to a higher or greater compensation. If this be true, should not the same principle govern between a railroad company and its employees? But the wealth and ability of a company is not a fixed but a variable quantity. Therefore the relations between the company and its employees must partake of these varying conditions; and any settlement between them, based upon present conditions and circumstances, cannot be a final and irrevocable adjustment, without violating every principle upon which justice and common good are founded. Now what justification is there for a compulsory arbitration law? Do not forget we have eliminated the public's interest from the question. As employees, do our necessities, conditions or welfare call for such interference? Have our relations with our employers been so unhappy, miserable and contentious that we have been goaded to resistance and strife; and in our struggles have been defeated and plundered? Has corporate capital become omnipotent, beneath whose shackles we toil as ancient slaves? It seems to me that the schedule of wages, of rules and regulations, which seem to be fair, and under which we labor, fairly contented on over a hundred roads, is a partial if not a complete answer. By virtue of our organization we have been recognized as a competent contracting party, worthy of respect and consideration. As a rule we have been able to settle disputes and controversies with our employers without violent or disastrous results. If the terms have not always been satisfactory we can congratulate ourselves that we had a voice in the making of those terms, and that in accepting them we retain and concede the right to a rejection or a renewal of them when conditions justify it.

While the railroad companies have become colossal institutions buying legislators and corrupting courts; exacting tributes, which are held in check, only by national law; so have labor organizations advanced in power and influence. The

right to organize and combine is no longer questioned. Numerically, they are a mighty aggregation, with a tendency to multiplication.

Education and experience has taught the several organizations that "in unity there is strength;" "that an injury to one is the concern of all." With increasing numbers; more diplomatic generals; with rights conceded to us, which have always been questioned; with a national recognition of our power and importance, why should we surrender any rights or privileges to an irresponsible arbitrating committee? It is by virtue of the power and influence which organization has developed that there is a tendency to legislation, which will restrict and control such power and influence. Having built up this power and influence by gradual and legitimate processes, would it be prudent or wise to forego the pleasure and profit accruing from such advantages? Having a more matured condition and better opportunities for the development and protection of our interests, why should we solicit the protection of an arbitrating guardian?

"Compulsory arbitration is a scheme to infringe upon the rights of the individual; to trespass upon his liberties. It is to rob organizations of their defensive weapons. It is foreign government versus home rule.

ROCHESTER, N. Y.

### **The Evil of Religious Strife.**

MR. EDITOR:—The MAGAZINE for April contains an editorial article, captioned "Furious Fanatics," which is of the nature of a general comment or reply to anonymous correspondents who take exception to the utterances of the editor on the subject of the A. P. A. in a previous number of the MAGAZINE; some of these anonymous correspondents going so far as to threaten the editor with the vengeance of the order unless he retracts. This shows how well the designs of our enemies have succeeded. The poison they have injected into us is doing its deadly work, doubtless to their utmost satisfaction. It is not at all strange that so prominent a person as the editor of the MAGAZINE should be threatened with assassination, when it is considered that such an obscure individual as the writer of this article is threatened in like manner, not by an anonymous correspondent, however, but directly by a self-confessed member of the order. The effort to arouse the average man to an intelligent interest in what is going on about him, or to the study of first principles, or the motives underlying the actions of people at any time, would seem to be as fruitless as the attempt of a sculptor to carve a marble statue out of a pan of dough. Nevertheless, "let us

reason together" for a moment. Can the organizers, the men in whose heads originated the idea of this order, be sincere in their avowed purpose to prevent a union of church and state, and to preserve American liberties and institutions from destruction by religious domination? If they are, why don't they go at it right, why not go to the bottom? Why don't they demand the retirement of the chaplains from the legislative halls of our nation, and the discontinuance of the practice of praying therein? And, in connection with this, why don't they oppose the entire body of Christians who, without regard to sect, creed, or nationality, are using every means in their power to have God put in the constitution? If they succeed in doing this, it will unite church and state in this nation and deprive us of all our liberties. We will then have Sunday laws, or any other laws that ministers of all religions may deem it to their interest to have enacted, and be forced to worship God according to law, or the dictates of men who know no more about God or the right way to worship him than we do ourselves. And if, perchance, there be some of us who do not believe in Gods of any kind, and who have, therefore, no desire to worship myths, having existence nowhere outside of the diseased imaginations of ignorant and superstitious people, we are liable, as of old, to feel the exhilarating sensations produced by the wheel, the thumbscrew and the rack—"all for the love of God," doncherknow! The fact that the A. P. A. does not try to prevent this is sufficient proof that its professions are false, and made only to cover up its real purpose, which is to create dissension among workingmen by playing on their religious prejudices, disrupt their labor organizations, and then in their weakened condition, work their will upon them. If people would only stop to think we could never be caught in any such a trap as the one set for us now; a trap baited with religious animosity by those who wish to enslave us. No thoughtful student of history, religious or secular, or of human nature, could become a member of any order, the advocacy of whose principles would be calculated to stir up religious strife. More bloodshed, tears and agony have been caused by religion, than all other things combined that have ever been used to set men to the work of cutting their neighbors' throats. The situation just now reminds me of a Spanish bull fight. The masses represent the bull; the red rag of religion is shook in our face, and, true to our natural instincts, we rush at it, while monopoly, our real enemy, whose intended victims we are, stands by with sword in hand to stab us to a vital spot as we rush by. Now, as often in the past, under the inspiring sentiment

of patriotism we are being led to use our massive power for our own injury. "What fools these mortals be!" Every workman in this country, where thought and speech are as yet comparatively free, should look with suspicion upon any organization purporting to be for his benefit, or, rather, the benefit of a portion of the working classes, whose principles its members are afraid, or ashamed, to proclaim and advocate in the broad open light of the day, in any community or presence; and no free-minded man will belong to such an organization, in a free country where he has the ballot in his hand.

*P. W. Monahan.*

GRAND JUNCTION, COLO.

### **The Old Dispensation.**

MR. EDITOR:—I see that Bros. Martin and Mayhall, from LaJunta, are making quite a record in the FIREMEN'S MAGAZINE as labor agitators. Bro. Martin waves the red flag and says that he is Irish, which I have no reason to dispute. Bro. Mayhall lays claim to being a tourist of some note and has known what it was to want a meal. Now, it was my pleasure to help make Bros. Martin and Mayhall B. of L. F. men, and it hurts me to see them take the pen and be among the first to try and pick flaws in the B. of L. F. to the advancement of the American Railway Union. I was always learned to praise the bridge that carried mesafely over, and if any of the timbers gave way, or became rotten, to replace them with new. Not so with Bros. Martin and Mayhall. They imagine that they have made a discovery—that the Old Dispensation is bound to sink; that it can't float any longer; that it is bound to go down with a crash, and they are like rats fleeing from a sinking ship, and they will take refuge in the "New Dispensation," as Bro. Martin styles it. Now, brothers, don't be alarmed.

The B. of L. F. has stood the storms of something like twenty-one winters, and to my knowledge the greatest portion of that time your names were not on the rolls. It was built up by older heads than yours, by men that had turned gray in the service, until it has become one of the greatest labor organizations in the world, in fact, second to none. Bro. Martin waves his flag and thinks he has gained a victory when he agrees with Bro. Carter that the heaviest expense borne by us are the assessments levied during strikes. But the good brother does not say what the assessment will be in his "New Dispensation" when they come to strike. Now let us examine this, good brother, and find out if he has any room for complaint. He has paid the very large amount of seventy-five cents in the heavy expense that he talks about. His heart must truly be as small as a mustard seed,

and as hard as flint, to let that small amount bother him. Where was the brother in 1888, when the monthly assessments were from \$7.00 to \$8.00 a month, levied to pay the C., B. & Q. strikers? Where was Mr. Martin during all the time we were assessed seventy-five cents every quarter for a protective fund, until we had accumulated \$65,000 or \$70,000? His name fails to appear on our rolls in all that time. Where was he? Even the echoes fail to answer. He is still dissatisfied and his large brain is working to try and destroy the order that has made him in part what he is. He refers to \$7.00 and \$10.00 quarterly dues that we ordinarily pay. I will refer the brother to the B. of L. F. constitution under the head of dues, and he can see very plainly that our dues are \$5.00 a quarter for three quarters, and \$7.00 for one quarter, making in all \$22.00 a year, with \$1,500.00 insurance. Now the rest of this very heavy expense that Bro. Martin is so eager to show to the public is local lodge dues, and has nothing to do with the order, as he very well knows. The brother allows that large and expensive brain of his to say that if we were relieved from our compulsory insurance, our assessments would be lighter. Now, is it not a positive fact with our compulsory insurance it makes it one among the cheapest insurance that can be obtained for the railroad men. Now, why is it that our worthy brother is so ready and willing to find fault with the order and the expense? Why has he not made a mark for himself and reduced them in a measure? His opportunities have been large. He represented his lodge at the last convention at Cincinnati. At the present time he is chairman of the firemen's local protective board, and last, but not least, he is master of his lodge. Now, I suppose that if there was any other office that the lodge could give him he would accept it with a smile and a "thank you brothers," and then take a head-of-time order for home and tax and worry his brain over an essay on the American Railway Union; tell what great advantages it had over all other orders; how cheap it was, and that there was no obligation to take, and that there was no chance for perjury; that it was free for all—Mexicans, dagoes and negroes—as Mr. Martin says that all it requires to be a member was to have your name on the books. But, Bro. Debs' answer, when asked who was eligible for the order, was anyone that drew pay from a railroad company. As the brother says, the field is large and the harvest will be great for the man that can control the vast army of railroad men in one order, and that order with neither corner stone nor foundation. Bro. Martin very well knows that the members in all other labor organizations are controlled by an obligation and a constitution providing some form of govern-

ment. But not so with the American Railway Union. Just draw pay from a railroad company and get your name on the books, is all that is required. I will ask the brother one question: If you were thrown out of employment now, which card would you travel on in seeking work? I rather think that you would drop back to the "Old Dispensation," as you know it has been tried and not found wanting. If I was Bro. Martin, and aspired for notoriety and the name of labor agitator, as he does, I would only hold membership in one order. I would not allow the members of the B. of L. F. to elect me to all the offices that there was any honor to hold, and then treat the order with as much contempt as he does in his writings. Ira, old boy, I have touched you light this time. Not but what you left many gaps down for a man to see that the office bee is buzzing in your hat. But you need not, in your wrath, consider me an enemy to the American Railway Union, as I am not. I am a warm friend to any labor organization founded on good principles, but I think that if you and Bro. Martin wish to advertise your new orders, that you should do it in some other way than through the pages of the FIREMEN'S MAGAZINE. Now, I am free to admit that I do not belong to the new order, and I am not able to say whether your writings are a work of art or not. But I am able to say that all writings like yours, and Bro. Martin's, when printed in the FIREMEN'S MAGAZINE, should be classed as patent medicine advertisements, and charged for accordingly.

LAJUNTA, COL.

Wm. D. Crane.

#### In Defense of the A. P. A.

MR. EDITOR:—In the March MAGAZINE I find an article written by A. J. Gray, and as I am a brotherhood fireman I consider it a duty as well as a pleasure to inform Mr. Gray that he is laboring under a great mistake with regard to the motive of the American Protective Association. The struggle of the wage laborers of the world is not for national or sectarian rights, it is a struggle for the rights of the human family—the rights of the oppressed as against the oppressor, the robbed as against the robber. Every wage worker who understands his rights as an American citizen is engaged in this glorious struggle. The A. P. A. does not interfere with any one's rights or liberties. The Roman Catholics may go through the land lecturing as they please and they will not be mobbed or greeted with riots, for the A. P. A. is composed of the best men in the nation; they are quiet, orderly law-abiding citizens. As for myself, I am not an A. P. A. man, but I respect the order and I wish it God speed, for it is constitutional and is actuated by the purest and noblest motives, and when it comes my

turn to vote I can be depended on to cast my ballot for one whose sole allegiance is to his God and his country, and not to any foreign potentate, be he prince or pope.

I read *Aesop's Fables* a few months ago, and one of them struck me as being appropriate to the times: There was once a simple flock of sheep, watched over by some faithful watch-dogs who night and day bravely defended them from the wolves. One day the wolves came to the sheep and said in a very bland way: "There is no enmity in our hearts against you; we should live at peace. The dogs are the ones who make all the trouble. They are wicked curs and keep up a feud between us, whereas if they were away we could live peaceably together." The simple sheep were deceived by the smooth words and evident good will of the wolves, and they thereupon dismissed the faithful watch-dogs. But that night the wolves came upon them, and as there were none to protect them the confiding sheep were all devoured.

It seems to me that the interpretation is clear: The flock is the American people; the A. P. A. is the watch-dog that guards the sheep from the wily attacks of the Romish wolves. It—the Romish church—says to us, "There is no enmity in our heart against you. We are all traveling the road to heaven, but we are taking different ways. We want to be at peace with you. We are loyal to the country; we love its laws; we uphold its public schools and all its institutions; let us be friends. But we cannot be while you have those curs of the A. P. A. at your heels. Send them away and we shall live peaceably together." Woe to the flock if it dismisses its faithful hounds! For the moment it does, that moment does the Roman Catholic church step into power, take the reins of government in her hands—they are almost there now—and then farewell to liberty and truth, freedom of speech and of the press; and then for the rack and the inquisition.

The democrats have spoken also of the "terrible persecution" that is being waged against them. If keeping them out of office is persecution, the meaning of that word has changed somewhat since last I saw it in the dictionary. And the change in its meaning since the Romish church had unlimited power till now, is so great as to form an anti-climax of the first order. It used to mean—under the sanction and by the authority of the holy Roman Catholic church and his holiness, the pope, and his minions—burning at the stake, stretching on the rack, piercing a body with spears, rending with wild beasts, throwing men and women from precipices to break their necks, and all because they were peaceable people who chose to worship God according to His commandments, and not according

to man's dictates. Has the Romish church forgotten, can she blot out the blood of the innocent ones who had kept the simple faith of the early Christian ages, and who lived a peaceable, happy life, but who were hunted like wild beasts and murdered because they worshipped God in spirit and in truth and in the beauty of holiness? Or the blood of the Huguenots, the most, peaceable, law-abiding citizens of France, who were foully murdered, and that at a time when Roman Catholics had pledged themselves to allow them freedom of worship? And this was when the Huguenots were off their guard, as they would like the Americans to be now.

It would take volumes to illustrate the meaning of persecution in the dark ages, when Rome reigned supreme and men obeyed the voice of the priest and the pope as the voice of God. 'Tis a pity our Romanist brethren would not open their nostrils and inhale a little of the smoke, figuratively speaking, that went up to heaven as an accusation at the burning of hundreds, aye, thousands, of innocent victims; beautiful young girls, young men in the strength of manhood, noble mothers and fathers, hoary headed men and women who suffered martyrdom because they read God's word and trusted in Jesus Christ as their Saviour and mediator instead of a priest. These were deeds of the holy Roman Catholic church, done under sanction and by the authority of her infallible popes. They were not sins, not even mistakes, but the doing of service to God. Her teachings were that it was fulfilling a duty to exterminate heretics, else why this wholesale slaughter? What is right for the pope is right for the layman. Her theology teaches that "the end justifies the means," but Paul says, "Do not evil that good may come," so we may judge if the Romish church clings to the bible.

But we need not go to the dark ages for persecution. Go to any Roman Catholic country and see how Protestants are treated. It is not many weeks ago that Gendreau, a man of unimpeachable character and pure life, was incarcerated for telling of the love of God on one of the street corners of that intensely Romish Province of Quebec. Rome's idea of liberty is, "Give up all your freedom to us." Her freedom is abject slavery. It seems to me that the ideas of the Romanists with regard to persecution must suffer somewhat, but then there are none so blind as those who will not see. Rome is on trial to-day in the United States. Loudly is she clamoring "Not guilty" to the charges brought against her, but we must take the proofs and the deeds, not the words. Rome has not changed; what she has done she will do again if she gets the power. If the lecturers who have lately

spoken to us tell untruths, why are not the Romanist men enough to meet them face to face on the platform before the people and answer the charges? None would be more glad than I to know they are untrue. Why not bring their books of theology—not the sugar coated pills which have lately been going the rounds—and show their doctrine, whether it is good or evil? Why not open their nunneries and let God's light reveal to us whether they are right or not? If these lecturers spoke falsely the Romanists would only be too glad to prove their innocence instead of striking cowardly blows in the rear. Again, if these men tell untruths, why not bring them before the law and punish them in a lawful manner? If a man should cover my fair name with infamy and slander, I would either pass it by unnoticed, or bring him to justice and maintain my cause. I would not waste my work in a vain way. Innocence is always fearless and will welcome investigation, but "error wounded writhes in pain." I do not wonder that Rome is howling against the lectures delivered against her; the wonder to me is that she does not hide herself in shame from the face of the earth. 'Tis enough to make anyone blush to have such a record brought to light. History does not lie; these facts cannot be gainsaid. They are written in blood which nothing can efface. The dogs bark but the caravan moves along. May the light and liberty of truth break through the clouds of ignorance and superstition, and may it bless the whole world.

*Leroy Miner.*

ESCANABA, MICH.

#### Certainly Right.

MR. EDITOR:—What is the A. P. A.? and what is it for? As an observer, as one who has studied this subject for a longer time than the A. P. A. has been in existence, if we mistake not, and as one who has studied every phase of the subject that has yet appeared, as such an observer we may be allowed to express ourselves.

As we understand it, the object of this association is chiefly, and in brief, to protect the American government and people from the domination of the papacy, by opposing every kind of union of church and state. It is therefore necessarily opposed to the encroachments of the papacy upon the government through any of her political scheming or aggression. That there is abundant room and great need of something of this kind being done is evident to every person who has watched, in any sort of fair minded way, the course of public or governmental affairs for the past twenty years or part thereof, or who will so watch affairs now. This the regular readers of the *American Sentinel*, the organ of the A. P. A.,

know full well, because all that the *Sentinel* has ever existed for is to point out these very evils and dangers. And now there are so many of them and they multiply so fast we can hardly describe them all as they pass.

That such work is proper according to every principle of the government and constitution of the United States, is plain to every person who knows the A, B, C of these principles or of the history of the making of the constitution and government of the United States. The government of the United States was established upon the principles of the total separation of the government from any church or religion, and specifically the Christian religion; and this for the express purpose of escaping any establishment of the Catholic church or religion. Jefferson and Madison and their fellow workers for civil and religious liberty, declared that "To judge for ourselves and to engage in the exercise of religion agreeably to the dictates of our own conscience, is an inalienable right, which, upon the principles on which the gospel was first propagated, and the reformation from popery carried on, can never be transferred to another." They said that "it is impossible for the magistrate to adjudge the right of preference among the various sects that profess the Christian faith, without erecting a claim to infallibility, which would lead us back to the church of Rome." They opposed all governmental favors to "the Christian religion," because, as they said, "Distant as it may be in its present form from the Inquisition, it differs from it only in degree. The one is the first step, the other is the last, in the career of intolerance." Thus spoke the heroes and patriots who established on this continent the separation of religion and the state as a government principle, and who made the government of the United States with the principle declared in its constitution. And they did it, as repeatedly declared, that the people of the United States might not be led back to Rome, to popery and to the Inquisition.

And the maintenance of these principles to-day for the same purpose for which they were established is as proper and as honorable as was the establishment of those principles in the beginning. It is as proper and honorable for men to-day to maintain these principles as it was for Jefferson and Madison to advocate them and secure their establishment as the principle of the government when the government was established. So far, therefore, as the object of the A. P. A. is concerned, it is precisely the object which the makers of the government had in view when they prohibited any connection of the government with any religion. In the object announced the

A. P. A. are in the company of Jefferson, Madison and their fellow workers in "the times of '76." The object, therefore, is as certainly right as that the principles of the United States government, as founded by our fathers, are right.

Of the political methods of the A. P. A. we know nothing personally. We have seen statements by Catholic papers and their partisans of what these methods are. But if we understand rightly, these methods of the A. P. A. are really known only to the members. And so, not knowing for ourselves these methods, and not being willing to take our information from the avowed enemies of the order, we are prepared to examine with perfect impartiality, whatever those methods may be supposed to be. By the report of the case in the Toledo court it appears that the A. P. A.'s of that city, at least, are arming. That is clearly wrong. It is only following the methods of the papacy, and it cannot win in opposition to the papacy. If this be true of the A. P. A.'s throughout the country, then they are all wrong in this particular, and should change their course at once in this matter.

If it be true that the A. P. A. proposes to accomplish its object by disfranchising or curtailing the political or civil rights of Catholics, that method is certainly wrong. If, however, the A. P. A. proposes to accomplish its object by recognizing the political and civil rights of Catholics equally with all others, while at the same time insisting that every citizen and every candidate for office shall faithfully maintain the fundamental principles of the government, and the plain provisions and intent of the constitution, then this is certainly right. If the A. P. A. proposes to accomplish its right object by the application of a religious test in any case, that method is wrong. If the A. P. A. proposes to accomplish its proper object by the test of the fundamental principles of the government and the provisions of the constitution in every case, then that method is certainly right. If the A. P. A. should apply even the test of the constitution and the fundamental principles of the government only to the Catholics, this method would be wrong. If the A. P. A. applies this proper test to professed Protestants and all others alike, then this is certainly right. If the A. P. A. opposes only Catholic aggression and encroachments upon the government, this is not enough. To be right it must oppose Protestant aggression and encroachment as well, and also every other that infringes to a hairbreadth the fundamental principles or the constitution of the government. If the A. P. A. opposes only Catholic interference with the public school, this is not enough. It must equally oppose Protestant interference with the public school. If the A. P. A. opposes

only religious interference with the public school, that is not enough. To be right and to further its avowed objects it must oppose all appropriations of the public money to any churches or religious orders for any purpose whatever; it must oppose this joint resolution which is now before congress, to add a religious amendment to the national constitution; it must oppose the assumption, on the part of the judiciary whether state or national, of insinuating religious matters into their decisions and imposing them upon the people as law; all this must the A. P. A. do if it will make good its avowed object of protecting the American government and the people from the dominion of papacy, and prevent the union of church and state.

It may be that the A. P. A. is doing all this. We sincerely hope so. It may be also, that the A. P. A. is doing all this in the right way, accomplishing the good and proper object of its organization by right methods in all things. This, also, we sincerely hope it is doing; for as the object of the A. P. A. is certainly right, we sincerely desire to see all its methods right, also, so that it can win. And, indeed, we want it to be right, whether it wins or not.

But, it is said, the A. P. A. is a secret organization. This is a queer cry to raise by anybody who knows anything about the papacy. The papacy is the most secret organization that was every on earth. The papacy being perfect mistress of ever element and method of secrecy, there can be no plan of secrecy devised in opposition to her, that can win. She can undermine them all.

Now, Bro. Debs, will you please explain why such an organization should have anything to do with organized labor, and cause the destruction of the brotherhood?

Unless we "poor devils," as you call us in the last issue of the *MAGAZINE*, are so narrow minded as to let our political and religious views bias our action toward our laboring brother. Don't you think if we are composed of such an element, and should the brotherhood die out of existence, there would not be much lost, and if partly composed of such an element that the sooner we are rid of their membership the better for us? We could not count on them in case of trouble, and we do not estimate our strength by the number of members alone, but by the tried and true brothers.

In regard to the form of obligation, how do you know it to be genuine? You are certainly mistaken about the A. P. A. being organized in New York. It was first organized and introduced in Iowa, and is, therefore, no "Wall street scheme."

Again I desire to call your attention to what, in my mind, gave birth to an organization called the "Amoreans," which ex-

isted some hundreds of years ago, and that of the A. P. A. of to-day. The oppression of the church in the past made it necessary for the existence of the Amoreans for the express purpose of protecting the liberties of the people. This same political oppression under the garb of religion caused the people of the eighteenth century to rise up in America and call a halt, which resulted in riots and bloodshed in many of our large American cities and drove from our soil the would-be pope, and now if I am correctly informed as to the mission of the A. P. A., it is to check and forever destroy the probabilities of any union of church and state, no matter by what denomination the attempt may be made; and that the order does not attack the religion of any church, but the political power, and is pledged to the ultimate destruction of political power being used by any religious body.

Yours fraternally.

J. D. Heffner.

LEXINGTON, KY.

#### A New Solution.

MR. EDITOR:—Under the caption, "Providing for the Needy," you criticize an article in the *Forum* for February, by Josephine S. Lowell, who traces the cause of our present "acute" and "chronic" distress to, (1) a surplus of unskilled labor; (2) low wages; (3) improvidence. The lady is credited with being familiar with "sociological problems," and consequently her solution of the question should command respect. She says: "To diminish the surplus of unskilled labor, one plain remedy is to cease to attract more unskilled people to the spot where there is already too many, and to deal with such as come naturally, in a way which, *while good for them, will not be agreeable to them.*"

The italics are mine. Can it be possible the same idea is cropping up in various parts of the country as solutions of the "sociological problem?" The lady hints darkly at a method of getting rid of surplus laborers "which will not be agreeable to them." You know that Dean Swift grimly suggested the eating of the redundant babies of the Irish population, as a means of furnishing food and at the same time reducing the superfluous population. Malthus advocated preventive measures for keeping the population within bounds, and considered that wars, plagues, and famines were nature's plans for reducing a too redundant population.

Now I have my share of local pride, and I desire this city shall receive credit for the first frank and outspoken method of dealing with surplus laborers in a way that "will not be agreeable to them."

A local writer has proposed a method of dealing with the question that may be something like what Mrs. Lowell darkly hints at.

He first draws attention to the "on to Washington" movement. He shows that there is no use closing our eyes to the fact that there are more laborers than is necessary for the production of wealth. He frankly admits that the reason offered by the socialists is correct, viz.: that the use of machinery is continually displacing laborers rendering them unnecessary. He makes copious extracts from a three column article in the *New York Sun* of recent date, which showed the enormous number of laborers, skilled and unskilled, who had been displaced by labor saving machinery, and the conclusion of the *Sun* that American workmen must make up their mind to have their days of employment decreased, as the production of wealth was yearly requiring less labor. But he scouts the proposition of the socialists, of a co-operative system of production and distribution. He admits that it would enormously increase the productive and distributive forces of society, indeed he opposes it on that very ground, because he claims the supplying of human wants would be so easy, that mankind would sink into a lethargic state of "innocuous desuetude," the absence of competition would remove all incentive to exertion and society would sink down to a dead level of nerveless mediocrity. So he concludes we must retain the competitive system for the purpose of keeping man up to a high standard of attainment, activity and progress. But competition must not be too excessive as that also is bad. Here is the gist of his proposition in his own words:

I have thought over the subject long and carefully and have fully evolved a plan that will make perpetual "good times;" that will solve the great industrial problem and make employment certain for all applicants; insuring also fair remuneration. I confess to a degree of pride and self congratulation in my success, for not one of the eminent authorities on political economy has given the world an outline of a scheme to solve the problem and allow our social and commercial system to remain unchanged. It is true the Nationalists claim to have proposed a theory of production that would abolish poverty and insure to everyone willing to work all the luxuries as well as the necessities of life; but these wicked agitators not only propose to destroy the tramp and make destitution impossible (and beyond this no good man would wish to go) but they mean to abolish the millionaire and make it impossible for the favored few to control the many. What a crude, barbarous state of society would ensue without millions of millionaires and private fortunes! Who would lead in social affairs? who would endow our universities, build our fine churches, pay the large salaries our best preachers earn, determine the fashion in dress, etc.? I fancy I can see an ignorant Nationalist blush in confusion over the practical question.

It is certain that the one cause of so many unemployed is simply because society does not require their labor. In other words the necessities and luxuries needed by society can be produced by probably one-third of the number of men who must exist by producing wealth.

In fact about four years ago one of the most distinguished statisticians of the age demonstrated that if all the million factories in the country were in full operation there would still be 75,000 workmen out of work, and in times of depression as the present, this surplus must extend into the millions. Now this is the plan. Let every county in every State of

the Union appoint a committee of investigation and let this body report the exact number of laboring men required in their district.

A census of the workmen will of course show the surplus number of producers and this surplus may be shipped to a central point previously selected. (The method of selecting this surplus may be accomplished by lot or any other way. It is a matter of trivial detail).

At the central point designated, the Government would build a large air tight structure prepared for the administration of chloroform, and there unhappy individuals that are causing the trouble and discomfort of modern society would be painlessly and rapidly dismissed from a world that has no need of their services.

I cheerfully admit, at this point, that the thoughtless and superficial, those who have not examined the social problem and have not made a special study of social conditions will at first glance object to this plan, and will do so conscientiously and from the best of motives, but I am prepared to meet and answer every honest objection. First, the practical business man and utilitarian will object on the ground of expense; but I am prepared to prove that all expenses may be met and in all probability the process would result in a profit. In the first place a great many could be canned and shipped to the Cannibal Islands—Mr. Mark Twain deserves some credit for this suggestion—and doubtless the natives would gladly exchange coconuts, bananas and other tropical fruits. Science has already demonstrated the human skin can be put to numberless profitable uses; an extra article of glue could be made; the bones even could be used. A few years ago the San Diego "Union" estimated that one tramp would furnish sufficient fertilizing matter to insure a healthy development of an orange tree. I need not waste more time on this objection: many other sources of profit will occur to any candid observer.

A second objection might spring from mere sentiment. A superficial sentimentalist may say society has no right to put innocent persons to death; they might go further and call it wholesale murder; but if society exercises on undoubted right to cause men to die the painful death of starvation, can it not cause the painless death of chloroform narcosis? Is society always careful that none but the guilty are killed on the battlefield? Those killed in war frequently die with no benefit to the survivors, but think of the enormous benefit to the workers that are left under my plan and to general society! no idle men, no surplus labor, everybody well paid! I have not the time to answer this objection in full and doubtless the good sense of the reader will discover other answers.

I will come at once to the most practical and important objection that can be urged. Many good Christians would regard the plan as an absolute blocking of the chief road to heaven. For there are many that know of but one path to the mansions of the blest; and that lies through giving cast-off winter flannels, worn out clothes and surplus cold meat to the poor.

There is but one way of keeping this well traveled highway open. In every district a few of the most infirm may be reserved as fit objects for alms giving and the exercise of charity.

The writer closes his article by stating that there are many other arguments that might be urged in favor of his proposition that will readily occur to any one interested in the subject. He is careful to state that the thinning out process would require to be renewed every few years according as advances in science and new inventions made men superfluous, or as he says: "In order to maintain the proportion of producers to the new condition from continual improvement in machinery and methods of production." The writer concludes with the assertion that he is without prejudice and will gladly abandon his plan in favor of

any other that could be shown to have any advantage of this scheme and still retain our competitive, social, and economic system.

It is unnecessary, I hope, to say, that I take no stock whatever in the plan proposed. I feel confident, notwithstanding the objections stated, that socialism is the only solution of the problem. Yet, as an alternative I think it only fair to present this writer's solution of the problem of what to do with our surplus labor under competitive conditions of production, and the inevitable displacement of labor, under private ownership of the means and instruments of production.

W. H. Stuart.

LOS ANGELES, CAL.

"A Better Financial System," by George C. Ward. 200 pages, paper cover, price 25 cents; issued from the press of the Arena Publishing Company, Boston, Mass.

This little book from the pen of a writer who is well known to readers of the MAGAZINE, is a masterly and thoroughly logical argument for the nationalization of our banking system. Mr. Ward takes for his text the financial plank of the Omaha platform of the people's party, and then, as stated in his introduction, he attempts to demonstrate that every principle of that platform "may be subverted and every demand realized by the nationalization of the banking system of the United States and the assumption, as a public function, by the government, of the banking business of the nation." There is no useless theorizing about Mr. Ward's treatment of his subject; he deals with facts, and he has been at infinite pains to collate a vast number of them all of which illustrate in a striking manner the correctness of the idea he is contending for. A notable chapter of the book is the one treating of "the volume of money;" standing by itself it should commend the book to the attention of students of finance. Mr. Ward shows that the range of prices that prevailed in the three year period 1867-70 might be obtained with a per capita circulation in excess of bank reserves of only \$16.45, and he says, "We are justified, then, in concluding that the demand for fifty dollars per capita is wild, visionary, and impracticable." And Mr. Ward has recognized a fact that a great many writers on finance are prone to forget—he has taken account of conditions. There is a great truth contained in the following paragraph which it would vastly benefit the majority of our financial doctors to reflect upon: "During 1867-70 the labor of the nation was fully employed and its ability to purchase and consume was limited only by its wages received. In 1890 the 'the army of the unemployed' numbered two millions. No amount of tinkering with the volume of

money can overcome the effects of these conditions." Mr. Ward shows that, with a system of governmental banking such as he advocates in operation, such panics as that of 1893, due to "lack of confidence," would be rendered impossible, and making the most liberal allowance for the expenses of conducting such a system, they would be more than covered by a rate of interest on loans not to exceed 2 per cent. per annum. The book should be read by all who are in favor of "A Better Financial System."

W. P. Borland.

#### THE BROTHERHOOD SEAT.

Of the many inventions I note on the rail,

There is one above others all engineers hail.

'Tis the "BROTHERHOOD" SEAT made by STANNARD &

WHITE.

And oh! boys, in old times it would give me de-

light

When my back used to ache till my eyeballs were red.

And my teeth, one by one, seemed to drop from my

head.

As I sat like "stiff," every lurch making groans.

At the way the old stub roads were grinding my

bones.

Those were days when we planted the seeds of dis-

ease

Which shall grow like ill weeds till our heartbeats

shall cease

Kidney ailments, dyspepsia, lumbago, dim sight.

And the blasted rheumatics I feel as I write.

We were tossed o'er rough joints and hove rail-ends

for years.

Till we nurtured the grass by the wayside with

tears.

All because we sat rigid in cold and in heat.

For no man yet invented the "BROTHERHOOD"

SEAT.

We old-timers, from bone-yards of physical ills,

Would advise men to guard against tonics and

pills.

By investing the price in this Common-Sense Seat.

For I feel in my heart that it cannot be beat.

Had I one long ago, oh, what songs I could sing.

But I groaned without back-rest or even a spring.

From my fancy these lines I most cheerfully write.

In behalf of the seat made by STANNARD & WHITE.

Shandy Maguire.

"Locomotive Mechanism and Engineering" is the title of a new book by H. C. Reagan from the press of John Wiley and Sons, 53 East 10th street, New York, N. Y. The book contains 145 illustrations, 300 pages, and sells at \$2.00 per copy. The author is a practical engineer and his style is clear and easily understood. His treatment of the various parts of the locomotive is that of a writer who is thoroughly familiar with his subject and locomotive engineers will find the new book a valuable acquisition to locomotive literature.

The members of Maumee Valley Lodge No. 512 B. of R. T. express their thanks to the members of Ann Arbor Lodge No. 421 B. of L. F. for the active part they took in the burial of the late Bro. Chas. McConell at Owosso, Mich. The kindness thus shown is fully appreciated and will be long remembered.

## ONLY A WOMAN.

Only a woman: shivering and old,  
The prey of the winds and prey of the cold!  
Cheeks that are shrunken.  
Eyes that are sunken,  
Lips that were never o'er bold,  
Only a woman, forsaken and poor,  
Asking for alms at the bronze church door.

Hark to the organ—roll upon roll  
The waves of its music go over the soul,  
Silks rustle past her,  
Faster and faster;  
The great bell ceases its toll.  
Fain would she enter, but not for the poor  
Swingeth wide open the bronze church door.

Only a woman, walling alone,  
Icily cold on an ice cold stone.  
What do they care for her,  
Mumbling a prayer for her—  
giving not bread, but a stone?  
Under rich laces their haughty hearts beat,  
Mocking the woes of their kin in the street.

Only a woman! In the old days  
Hope caroled to her the happiest lays,  
Somebody missed her,  
Somebody crowned her with praise,  
Somebody faced out the battle of life,  
Strong for her sake who was mother and wife.

Somebody lies with a tress of her hair  
Light on his heart where the death shadows are,  
Somebody waits for her,  
Opening the gates for her,  
Giving delight for despair.  
Only a woman—never more!  
She is dead in snow at the bronze church door.

—From an Unknown Author.

The publishers of *Locomotive Engineering* are giving their subscribers for 1894 three educational charts of great value. Chart No. 2 has just been issued and represents a modern locomotive, a marvel of perfection, with each part accurately named and numbered and there has been such a demand for these charts that the publishers have had a supply prepared on coated paper for framing which can be had for 50 cents per copy. Address *Locomotive Engineering*, 5 Beekman street, New York City.

Two books of special value from the publishing house of Lee and Shepard, Boston, are on our table, viz: "The Co-operative Commonwealth" by Lawrence Gronlund and "The Speeches, Lectures and Letters" of Wendell Phillips. Both are books of the day, gotten up in a cheap yet substantial form, and should be in the library of every student of current events. Price 50 cents each. Address Lee and Shepard, 10 Milk street, Boston.

The Maine railroad commission reports that of 6,332,535 passengers carried in that state last year only one was killed and but ten was injured, seven of these but slightly. Of the employees six were killed and thirty-one injured. It is probable that the peaceful avocation of farming was attended in the same state with a much greater number of casualties and fatalities than resulted from the operation of 1,400 miles of railways.—*Railway Age*.

## The American Telegraph System.

In an interview in the *Telegraph Age* Colonel R. C. Clowry, vice president of the Western Union Telegraph company, says, regarding some comparisons made between British and American telegraph systems:

"The British telegraph system comprises but about 30,000 miles of line, 190,000 miles of wire and 8,000 offices, extending over an area of about 120,000 square miles; while the Western Union telegraph system alone comprises about 190,000 miles of line, 750,000 miles of wire, 8,500 miles of ocean submarine cables and 22,000 offices, extending throughout an area of more than 3,000,000 square miles, being therefore about quadruple the British government telegraph system, and extending over an area twenty-four times as great. The capital account of the cost to the British government of its telegraph system is \$50,000,000. If the Western Union Telegraph company's capital account was in proportion to its property in the same ratio it would be over \$200,000,000.

"During the past summer I have met and conversed with representative electricians from nearly all parts of the world, who came here to visit the exposition. Each of them has inspected the Western Union office and system in Chicago, and in every case has stated distinctly that the progress of telegraphy in the United States was very far in advance of what it was in Europe. Our instruments, switchboards, etc., appear to be a revelation to most of them. Then again the United States is the only country in which telegraph lines are operated direct from dynamo current. In Europe they still adhere to the old battery system (in some cases using storage batteries), and the gentlemen who visited me were surprised to see the great advance we have made in this direction. The only European instruments which we have adopted in this country are the English Wheatstone, which we work to advantage on some of our long circuits, while in England they are gradually substituting our Morse system, including the duplex, quadruplex, etc., for their old machinery. In fact an electric manufacturing company of Chicago is shipping telegraph instruments to nearly all parts of Europe. It appears to me therefore that the United States is very much in advance of all European countries in all branches of electrical industries, the telegraph and telephone included, and in fact in all mechanical industries, very nearly all of the great inventions having been made by Americans"—*Railway Age*.

## Addresses Wanted.

G. J. FLYNN, ALPHUS MCLENDON, and ROBT P. CONANT—Members of Mission Lodge, No. 281, are requested to correspond with the Secretary of their lodge.

**TWO SINNERS.**

There was a man, it is said, one time,  
Who went astray in his youthful prime.  
Can the brain keep cool and the heart keep quiet  
When the blood is a river that is running riot?  
And boys will be boys, the old folks say,  
And a man's the better who's had his day.

The sinner reformed, and the preacher told  
Of the prodigal son who came back to the fold,  
And Christian people threw open the door  
With a warmer welcome than ever before:  
Wealth and honor were his to command,  
And a spotless woman gave him her hand;  
And the world strewed their pathway with flowers  
a-bloom.  
Crying: "God bless lady and God bless bridegroom!"

There was a maiden went astray  
In the golden dawn of her life's young day:  
She had more passion and heart than head,  
And she followed blindly where fond love led;  
And love unchecked is a dangerous guide,  
To wander at will by a fair girl's side.

The woman repented and turned from sin,  
But no door opened to let her in;  
The preacher prayed that she might be forgiven,  
And told her look for mercy in heaven;  
For this is the law of earth we know,  
That the woman is scorned while the man may go.  
A brave man wedded her, after all,  
But the world said, frowningly: "We shall not call!"  
*Ella Wheeler Wilcox.*

**Color-Blindness.**

The importance of color-blindness is world-wide. It concerns all who travel by water or by rail, for upon proper recognition of colored signals the safety of vessels and of trains depends; and it so happens that the colors used for signaling are so imperfectly recognized by four men out of every hundred that they may be confounded the one with the other. To you as guardians of the safety of the traveling public the importance of the subject primarily appeals; for to you it looks for its guidance, and from you should emanate measures for its protection.

Many of you are perfectly familiar with color-blindness, all of you should be; and to that end I shall present a brief and practical exposition of the subject, hoping that it will excite your interest and further investigation.

Color-blindness, which in no way interferes with the sharpest sight, may be complete when no colors are perceived and intensity of light as light and shadow is the only guide to the outline and recognition of objects; or the defect may apply to one or more of the primary colors. But the most frequent form is blindness for red and green, which alone concerns us, and is found in four out of every hundred men and one out of every five hundred women.

Color-blindness affects all races and conditions of men. It is hereditary, congenital and incurable, but at times may be palliated.

Color-blindness may be acquired from disease or disturbance of the central nervous system when it is only with—usually—

other symptoms of a general disorder, and is not classed as true color-blindness.

Experience has demonstrated the necessity of using red and green signals on railways, and custom has settled upon the former color to indicate danger and the latter caution, while white means safety. Now a color-blind person cannot distinguish accurately between red and green, for he relies upon their luminosity or brightness alone in reaching his conclusions, and under certain conditions he may confound either of these colors with white. Hence it becomes a matter of serious moment to detect the four per cent. of such individuals among railway employees.

In devising tests for this purpose it was soon discovered that such as required the naming of colors was unsatisfactory, for defective nomenclature and perfect color perception often coexist; and final selection was made of those tests which required the matching and comparison of colored objects, without the naming of any. That known as Holmgren's has received the sanction of almost universal adoption, and will alone be demonstrated. Holmgren's test consists of a set of Berlin worsteds containing upwards of a hundred small skeins composed of reds, greens, yellows, blues and their derivatives, and browns and grays (these latter "being confusion" colors); and besides these three skeins of larger size, known as "test skeins" and colored respectively green, pink and red.

The method of applying this test is to loosely pile the worsteds on a white cloth in a good light, and, placing the large test skein of green aside, the person to be examined is asked to select and pick out of the general heap those skeins of the same color, darker or lighter, and put them beside it. The normal eyed will do this quickly and without difficulty, but the color-blind will show his defect by selecting besides the greens, or without them, some of the grays, light browns, pale and even full reds.

The test need go no further to prove color-blindness, but Holmgren advises that its variety be established, and this is done by remixing the worsted, laying aside the large pink test skein, and asking the examinee to select and pick out all the lighter and darker shades of this color. He will pick out blues, violets or bluish green and show predominance of red-blindness, or full green and grays, and demonstrate that green-blindness is strongest. Defective perception for green means faulty perception of red, however, and vice versa. Other forms of color-blindness are as rare as they are unimportant from a practical standpoint, and we may pass them by.

A further test which is of some practical value, because it illustrates the mistakes which may occur in signaling with the color—

blind, is with the large red test skein, the color of which corresponds to the danger signal of railroads. This is laid aside and the examinee is asked to pick out the colors which match it. He will select reds, browns and greens, preferring the darker shades of these colors if he is red blind, and lighter ones if he is green-blind.

It is obvious from these exhibitions that color-blind people should find no employment on railroads where signals must be recognized. Safety certainly requires this and discountenances even palliation of the condition.

Palliation can be effected, however, and when the means of doing so are thoroughly understood by intelligent, conscientious and painstaking men, I believe it can be done with safety. The plan was suggested by Maxwell and consists in viewing signals through red and green glass simultaneously. Looking through a red glass a red flag is made lighter and a red light is clearly seen, while a green flag is made darker and a green light is much obscured. Looking through a green glass the red flag is made darker and the red light is much obscured, while the green flag is made lighter and the green light is clearly seen.

### Unnecessary Reduction of Employees.

One of our contemporaries, which has been devoting a great deal of space and labor lately to arguing that railroad men of all classes are in duty bound to accept reduction of pay without a murmur, injects upon railroad officials the question: "If you had to pay the salaries of all the men employed out of your own individual income, do you think there would be as many employed?" An attempt is then made to answer the question in the negative. We believe that we have enjoyed as good opportunities for observing the conditions of employment on railroads and in private firms as any person connected with the *Railway Age*, and the result of our observations is that we consider that railroad officers as a rule are less given to retaining superfluous help than any other kind of employer. A private employer, whose individual income suffers most severely in hard times, will often keep on old employees when there is little for them to do, partly through benevolent instincts and partly because it is good business policy to retain valuable men. In the course of numerous tours made during the last three months, we have been greatly impressed with the sympathy that private employers display towards those dependent upon them, and with the number of manufacturing establishments that are kept running with the expenses greater than the income. This is done for the purpose of providing a livelihood for the workmen

under circumstances when it would be money in the pockets of the employers to close down the works.

We regret to say that we have seen very little of this benevolent spirit among railroad officers. They are hounded so with orders to reduce expenses that they appear to have no bowels of compassion. Those who perceive that they are losing valuable men who will be hard to replace when business revives, and understand that the policy will be costly in the end, perform the acts of harshness because they have no option in the matter. To the manipulator of stocks, the individual employe is a mere machine. Supply and demand is his highest law, and he cares nothing for depriving men of employment. Men of this stamp give orders that operating expenses of railroads be reduced, and the executive officers have to obey or get out.

The present lamentable depression of business has been greatly intensified by this tendency of railroad stock owners and gamblers to reduce operating expenses, and stop purchasing everything not absolutely required to keep trains going. It is the most shortsighted kind of business policy, and ultimately causes increase in the expense necessary; but those who pursue it care for nothing but the present, and their acts exert disastrous influence upon the welfare of the whole country. There is certainly no reason to find fault with the men in charge of railroad operating for keeping at work men whose services might be dispensed with. The cause for regret is all in the opposite direction.—*Locomotive Engineering*.

### Germany's Electric System.

In Germany they do not operate the telegraph and telephone on the same plan as prevails in the United States. Details of the way in which Emperor William's country manages the electrical department of the government were recently related to a reporter by Heinrich Hofmeister, director of the German telegraph system and superintendent of the cable system at Emden. On being asked to state the difference between telegraphic service in his country and this, Dr. Hofmeister said:

"The greatest difference which I have observed is that we do more for the small towns and the villages all over the empire. We have arranged it so that the smallest communities have a service twice a day for letters, newspapers, packages and money, and that they have an efficient telegraph and telephone service. In Germany the mails, the telegraph and the telephone are confined in one department, known as the *reichspostamt*, or, as you would call it, the postal department. Dr. von Stephan is at

its head, and since 1876 his strong personality has been bent to this one end, that in the matter of intercommunication the people shall have a perfect service at the minimum of cost. His success has been wonderful and his work is the admiration of the world. His theory is that effective service at low rates multiplies business. His slogan was 'reduce the tariff.'

"How do your tolls compare with the rates of this country?" was asked.

"Very much lower. The charge for a ten-word message to any part of the empire is 50 pfennigs, or 12½ cents in your money."

"Irrespective of distance?"

"Yes. It is the same for five miles as for fifty."

"What are the telephone tolls?"

"Twenty-five cents for five minutes' conversation. We do not take distance into account. You can talk from Berlin to Hamburg at the same rate as to the nearest station. We charge individual subscribers 150 marks (about \$36) a year for the use of the telephone, and there is no charge for switches."

"Is there a deficit or a surplus at these rates?"

"O a handsome surplus every year, which is turned into the general treasury. Lest you may think the charges by your private corporations are too high as compared with ours, I ought in justice to say that we operate much of our mails, telegraph and telephone system conjointly. In small places one man acts as postal clerk, telegraph operator and telephone manager. When we added the telephone service we did not incur in many places additional cost for buildings, employes and incidental expenses. But, as I said before, the people of the interior are better served than Americans. We provide fire alarms, calls for physicians, weather reports, etc., and we are always prepared for emergencies."

"Do you still string wires on poles?"

"Indeed not. We abolished overhead wires long ago, not only in the cities, but throughout the empire. We employ underground cables, containing seven hard copper wires, constructed like submarine cables, and incased in iron pipes like gas mains. Germany is one gigantic spider web of underground cables. Main lines radiate from Berlin to the outermost edges of the country, and these radiating lines are joined together at regular intervals. 'Spider web' exactly describes the system. It is Dr. von Stephan's chef d'œuvre. With this network under the earth no meteorological disturbance, however severe, can interfere with the perfect working of the wires from Berlin to any part of the realm. No invading army could cut the wires unless it dug trenches over the face

of the empire. Occasionally we string wires on poles in the country, but we use two poles strongly braced to support the crossarms, much like the bents of a bridge, and we put up porcelain insulators, which prevent the escape of the electric current. It seems to me that in this country your poles are too flimsy and your glass insulators imperfect."—*Electrical Worker*.

### Barnabee's Prize Story.

The following story, ascribed to H. C. Barnabee, of the Bostonians, won second prize in a contest for the best story sent to *Life's Calendar*:

A well known Congregationalist clergyman of Boston went to an eminent dentist of that city to have himself supplied with a new set of teeth. After several pilgrimages, the work was completed. The clergyman, who possessed a voice pitched in an almost feminine key, stepped from the operating chair and, standing before a long mirror, began to grimace, opening his mouth wide so as to show his new set of teeth. He finally burst out with the exclamation, "Jesus Christ!" The dentist, who was a religious man and who did not know that his patient was a clergyman, upon the repetition two or three times of the sacred name, protested most vigorously against what he considered a blasphemy. The good clergyman, astonished, turned from the mirror and said: "My good friend, I'm not swearing. It is 30 years since I've been able to pronounce the name of my blessed Redeemer without whistling."

### Figures Tell the Story.

In England and Wales one hundred persons own 4,000,000 acres. In England, in 1887, one-thirteenth of the people owned two-thirds of the national wealth.

Seventy persons own one-half of Scotland; 1,700 own nine-tenths; twelve per cent. own 4,046,000 acres.

In Ireland less than eight hundred persons own one-half the land; 492 members of the house of lords own 14,250,012 acres, which rent for \$57,865,630. The total number of tenant farmers in England, Scotland and Wales, is 1,060,639, and of these Ireland furnishes 574,222 and England 314,800.

England's war debt is \$3,600,000,000, and the English bondholders fatten on an interest of \$313,004,360 annually drawn from the industrial population of that country.

In London relief was given to 88,164 paupers in one week. It takes 14,000 policemen to guard London's population.

In the United States seventy persons are worth \$700,000,000—and less than fifty of these can control the currency and commerce of the country on a day's notice. One hundred are worth \$300,000,000 and

24,000 own over one-half the total wealth. The census shows that the railroads of the country own 281,000,000 acres of land, and foreign and domestic syndicates 84,000,000, making a total of 365,000,000.

In New York City 10,000 of the 2,000,000 inhabitants own nearly the whole city, and only 13,000 own any real estate.

In Chicago—population 1,200,000—less than three and one-half per cent. own all the real estate.

Total number of millionaires, 30,000.

Total number of people out of work, over 1,000,000.

The number of tramps, 500,000.

Ex-soldiers in poor houses, 60,000; bondholders, none.

Estimated that 10,000 children die from lack of food in this country annually.

There were 57,000 homeless children in the United States in 1880.

In New York 400,000 working women are so poorly paid that they must accept charity, sell their bodies or starve. In one precinct twenty-seven murdered babies were picked up; six in vaults.

New York has 1,000 millionaires.—*Cleveland Citizen*.

### Mules are not Fools.

One day on a railroad an engineer scared up a mule on the track beside him. They were about two miles from a bridge at the time; knowing the fashion all animals have of running straight ahead on the track instead of putting their common sense on the matter and sheering off to one side, the engineer fairly made the surrounding country ring with the noise of his whistle, so as to get clear of the mule before they got to the bridge. But Mr. Mule seemed to think that the whistle was intended only to keep him on the track and make him run faster, and he kept straight on at redoubled speed. Of course the engine could easily have overtaken him and knocked him to smithereens, but as that might have resulted in knocking the train into the same kind of fragments, the engineer slackened speed a little, and finally stopped and sent the fireman out to drive the beast off the track.

That was done several times, but each time the fireman had hardly got back into the cab again when the mule was on the track the same as before, and tearing ahead like mad. In fact, the thing was becoming very monotonous, when, looking up suddenly, the engineer saw that he was very close to the bridge. Then he began to get uneasy, for fear the idiot of a mule—as he thought the animal to be—was going to try to cross the bridge, though how he would manage to step on the ties sure-footed the puzzled railroader could not understand.

They were so near the bridge by that

time that the engineer dared not go another rod, so he stopped short, just as the old mule dashed off across a field, braying like a good fellow. And then the engineer and fireman saw the game the wise old animal was playing. Right in the middle of the bridge was another mule stuck fast, with his legs between the ties.

The old railroader insists upon it that the mule had kept on the track to make the train go slow, and thus prevent it from coming into collision with the mule on the bridge, not because it cared so much about the fate of its companion, but to save the train from wreck.—*Los Angeles Herald*.

### What Interested Napoleon.

At one of Napoleon's reviews an old grenadier who had made the campaigns of Italy and Egypt, not hearing his name pronounced, left the ranks and asked for the Legion of Honor. "What have you done," said Napoleon, "to obtain this recompense?" "It was I, sire, who, in the desert of Jaffa, in a dreadful heat, offered you a watermelon." "I thank you again for it, but that is not worth the Legion of Honor." The grenadier who, so far, had been as cold as ice, flew into a paroxysm, and said with great volubility: "Do you count for nothing seven wounds received at the bridge of Arcola, at Lodi, at Castiglione, at the Pyramids, at Saint Jean d'Acre, at Austerlitz, at Friedland—eleven campaigns in Italy, in Egypt, in Austria, in Prussia, in Poland?" Here the emperor interrupted him, and imitating his vivacious language, said: "Well, well, well! how you scream! Now you come to essential points; you end where you ought to have begun; this is better than your watermelon."—*San Francisco Argonaut*.

### TURNING THE FLOWERS.

Out in the country where two roads met,  
A cottage with open door I found;  
The board for the evening meal was set,  
The good wife bustled busily round.  
It was homely and plain—but oh, so sweet,  
With rose and lavender freshly culled,  
And there, in a cradle, just at my feet,  
A beautiful babe to sleep lay lulled.

I sat me down, with a bidden right,  
And a sense of comfort over me stole;  
The board, though homely, was clean and white,  
And flowers were upon it—set in a bowl.  
And the good wife said unto me, her guest,  
As she twisted the blooms in the bowl so brown:  
"I like to turn what are freshest and best  
To the side where the man of the house sits down."

I looked at the flowers—so white, so red;  
I gazed at the happy-faced busy wife,  
And, "That is a nice idea," I said:  
"I wish we could carry it all through life.  
For the world would be a far happier place,  
And many a glint through the darkness loom,  
If we 'turned the flowers' with a tactful grace,  
And showed the glory instead of the gloom."

—*Tri-State Grocer*.

**A MODEST MAN.**

I'd fain so live that my last sleeping-place  
Will need no shaft far reaching into space,  
To blazon to the people's wondering eyes  
Great deeds of might and marvelous enterprise.  
No wish have I to lead my fellowmen  
To bloody war; nor sway them with my pen.  
I only ask that such my life may be  
That on the stone which is set over me  
May be this short description of my worth:  
"Here lies the bones of one who owned the earth."  
—*Indianapolis Journal.*

**An English Engine-Driver.**

An engine-driver, recounting his experience, said that he had thus far escaped smash-up, but that he thought he was in great danger one night. Said he: "It was a clear autumn evening, and I was running a passenger train. We were a little behind time, and I was going along at a good pace. There was a big wood to go through, and the line, on clearing it, took a sharp turn to the westward. Just as we made that turn my heart came right up between my teeth, for there, coming straight down the line was another engine, with her headlight flaming in my eyes.

"I blew down brakes, and had my engine reversed before I'd drawn half a breath, sent the train back as hard as I could to a siding about a mile behind us, and waited for the other train that I supposed to be close by, but she didn't come. I made the signalman wire up the line to see if there was any special or runaway engine in the way, but the answer was that the line was clear.

"The passengers got out and began to talk and ask questions, and as for me, I was dazed. I thought of runaway locomotives and train-wreckers. Everything was quiet around the bend as far as I could see and hear. Presently I happened to glance westward across a clearing; there was the headlight shining through the trees as serene and steady as you please. It was the planet Venus."

**Premiums on Naval Vessels.**

The interesting statement comes from San Francisco that an error of 12 pounds has been proven to exist in the Navy department steam gauges used in testing the "Monterey" and the "Olympia," cruisers built by the Union Iron Works, of San Francisco, which works suffered pecuniarily on account of an apparent deficiency in the machinery of the first named vessel, represented by 12 pounds boiler pressure. When just the same deficiency was shown in the second vessel suspicion was aroused, and the Mare Island Navy Yard gauges examined.

Of course there can be but one fair and honorable way of dealing with such a case, and that is to fully reimburse the Union Iron Works, even if a special law of congress be required for the purpose; and in the

meantime it would be very interesting to know just how the government gauges came to be so much in error at a time when so much depended upon their being right.

It so happens that contemporarily with this discovery some little stir is being made about the matter of premiums paid by the government to contractors for performances of vessels beyond contract requirements in respect either to horse-power or speed; it being charged that things are so arranged between the officers of the Navy and the contractors that the large premiums can be readily earned.

There are, of course, a hundred ways in which engineers of the Navy department, so disposed, could arrange things so that certain favored contractors might know in advance that a large premium was to be earned on any given vessel, but we think if those who are charging such things against officers of the Navy were somewhat better acquainted with the methods of the department and with its personnel they would know that such a charge is about the last one likely to have any truth whatever in it.

—*American Machinist.*

**The First Mint.**

Massachusetts was the first of the colonies to establish a mint. It was located in Boston, and was in charge of John Hull, who was bound under oath to coin, by the help of God, every shilling of three penny troy weight and other pieces in proportion. "So neere a you can," was the considerate concession made by the court that would not be too strict in its demands on a man's ability to coin money to a nicety with the rude implements then in vogue. Hull was to have one shilling out of every twenty. The business proved to be so good that when Hull's daughter married Judge Samuel Sewall, her father gave her as dowry her weight in silver. The story goes that after the wedding ceremony a large steelyard was brought into the room and the bride was placed upon one of its platforms, while pine tree shillings were poured into a tub upon the other side until the steelyard balanced. These New England coins had for their device a tree, at first a willow, then an oak, and last a pine. The date on most of them was 1652, for our prudent fathers saw no reason for changing the die every year. This indifference served them a good purpose on one occasion, for Charles II., learning that the people of New England were coining their own money, was very much displeased. In a conversation with Sir Thomas Temple he expressed his indignation in no mild terms. Sir Thomas was a good friend to the colonists and had spent several years in New England. He apologized for them on account of their ignorance of the law, and took from his pocket some

of the oak-tree shillings. He told the king that the people of Massachusetts had adopted the oak as the emblem of their loyalty to his majesty, inasmuch as that tree had saved the life of their king. This satisfied Charles, who good naturedly smiled and called the Massachusetts people "a parcel of honest dogs."

### A Creede Burial.

"Can a feller buy a stack of blues in here to-day?"

"Not to-day, partner."

"What's the matter?"

"Well, Joe Simmons is being buried to-day, and the house is closed until after the funeral."

"Who was Joe Simmons?"

"How long have you been in the camp?"

"Come in on the afternoon train."

"Thought so. Well, Joe Simmons was Jeff Smith's best friend. This is Jeff's house, and not a card will be turned or a drink sold until Joe's remains have been carefully planted. You can slide up to the bar and gulp one to Joe's health beyond the range, but your money don't go."

The above conversation took place at the Orleans club in this camp Sunday afternoon, says the Creede (Col.) *Chronicle*. The inquiring party was a miner fresh from Leadville. The man who responded was the barkeeper at the club. After the drink the mixologist waxed talkative. "I've known Jeff Smith," he said, "for a number of years, but I never saw him knocked such a twister as when he found out that Joe had to die. Down in Texas, years ago, both of 'em was kids together. They went to an old log school-house and helped each other to annoy the teacher and get a little learning. Then they went to punchin' cows and worked for the same outfit, afterward graduating into the Texas rangers. They ran together, swore together—yes, and I guess they skinned many a spicker together, too—but they never gave a friend dirt."

"Well, Joe comes into camp when he hears the boom is on, and went to dealin' for Jeff. He finally got sick—pneumonia—and Friday night a few moments before 12 o'clock Jeff goes up to his room. Joe was dyin' and Jeff knowed it, but he tried to give him a stall that he was looking all right."

"Don't lie to me, Jeff," says Joe. "I know I'm dyin'. My last chip will be cashed in very soon, and I want to say good-by to you. You won't have no preachin' at my sent-off, will you? No. Good. Just lay me out and wish me good health on the other side of the range, if there is another side and any health there. Good-by, old pard; I'm off!"

"Them was the last words Joe spoke, and

Jeff came down to the saloon and cried like a baby. He says to me: 'Chick, the whitest man on earth just died,' and I knowed what he meant. But there goes the funeral procession."

Joe Simmons was one of the best known gamblers in the west. He was Smith's schoolday friend, and the last wishes of his friend were sacred trust to him. Accordingly, the funeral which took place Sunday and the services at the grave were perhaps the most unique ever witnessed. It is seldom that Bacchus is called upon to preside at the grave. But the sound of the popping champagne corks mingled with the curses of the ore drivers as they swung their lead-ers along the narrow trail which passes beside God's acre on the broad plateau above this rustling camp. Yet the remains of a human being were being consigned to their last resting place. At 2 o'clock the funeral cortege left the undertaker's. A wagon containing the deceased was in advance. Next followed the only hack in town, containing Jeff Smith, John Kinneavy, Hugh Monan, and a *Chronicle* reporter. Wagons with fifty friends of the departed followed.

A blinding snow storm was in progress, but the horses plodded up the steep hillside. When half way up the mourners were forced to get out and walk to the head of the hill, as the horses couldn't stand the strain.

Finally the cemetery was reached. Six mounds of earth ominously close together marked it. A gaping, oblong hole had been dug beside the last mound. When the box had been taken from the improvised hearse it was lowered into the grave. Every head was uncovered, and Jeff Smith, standing at the foot of the grave, thus addressed the throng:

"The man whom we have just laid to rest was the best friend I ever had. You all know him. Did any of you ever know him to do anything that wasn't square with his friends? No. I thought not. Neither did I. The best we can do now is to wish him the best there is in the land beyond the range, or the hereafter, if there is any hereafter. Joe didn't think there was, and I don't know anything about it. Friends, I ain't much of a speaker. But Joe was my friend, and all he wanted was for us to gather at his grave and drink his health when he was gone. Let us do it."

Twelve bottles of Pommery were then opened, and each of the assemblage took his glass in hand, while Smith said: "Here's to the health of Joe Simmons in the hereafter, if there is a hereafter." The glasses were drained. Then all joined hands around the grave and sang "Auld Lang Syne."

It was a strange and weird sight. The snow was falling in thick, heavy clouds,

and for a moment the sun came out above the crested cliffs and glinted on the glasses, giving a new sparkle to the wine that toasted the obsequies of the dead sport. Sorrow for the nonce was drowned by an offering to Bacchus.

The dirt was filled into the grave and the cortege returned to town. In a few moments they were busy again with the cards and chips, and the Orleans club opened for business.

This event, at which perhaps the outside world would stand aghast, simply proved that the sporting element of a mining camp regard the last wishes of the dying as a duty to be performed faithfully. They may be outside the pale of the world in many things, but they practice the broad principles of humanity. How many centres of civilization do this?—*Creede Chronicle*.

#### Imprisoned in a Bottle.

Some time ago a druggist of Putnam, Conn., threw a lot of empty bottles into the back yard of his store, and recently, while he was strolling there, he heard one bottle clinking against the rest in a peculiar way. The bottle rolled around like it was bewitched. The druggist picked up the locomotive bottle, and was astonished to see a rat gallivanting inside it. He was a big gray fellow, while the bottle nozzle is scarcely big enough to let a man thrust his finger into it. The rat's body is more than three times larger than the orifice, and the mystery is how did the rat ever get in the bottle.

The druggist has placed the imprisoned rat on the counter in his store, and scores of people inspect it daily. It is the conjecture of a scientific Putnam citizen, who is familiar with the habit of rats, that it crawled into the bottle when young, and, since it is known that rats help one another in tribulation, that the animal's mother has visited the bottle daily and contrived to thrust food into it. The rat appears to be in excellent health, and apparently is happy and contented.—*Philadelphia Ledger*.

An engineer, who now considers himself "too old to begin," recently remarked to the writer that looking back over his life he considered one of the great disabilities under which he had labored was his inability to make a respectable free-hand sketch. This is a matter of greater importance to some than to others, and what he said may not have been much exaggerated. At any rate, it is a matter of a good deal of importance to mechanics, and especially so to machinists. Almost every one knows of some machinist who attends to outside work a good deal, who will bring to the shop such a sketch of what is re-

quired as would fill a draftsman's heart with envy. And we know that he gets paid for this accomplishment. Everybody has noticed at school that some boys "take naturally" to sketching forms, surreptitiously, while others never cause their teachers trouble in this respect. It would probably be said of the boy who showed uncommon proficiency in this that he was a genius, but every boy has got enough of genius to learn to do something in the way of sketching, and he should learn it if it requires a good deal of effort. He should be compelled to learn something of it as a part of his common-school education, and if he learns a trade should follow it up during his apprenticeship.—*American Machinist*.

#### An Engineer's Story.

I once had an interesting experience with a quicksand. My engine ran off a low bridge near River Bend, about 100 miles east of Denver, and fell into a small creek filled with quicksands. A wrecking train came up in a few hours, but the engine had entirely disappeared. The railroad officials ordered it raised, but it could not be found. We sounded with rods to a depth of over sixty feet, but not a trace did we discover of the engine, which had vanished as completely as if it had never existed.

"Four years afterward it was found at a depth of over 100 feet and was raised. We then ascertained there was scarcely a bit of rust on it, the breaks were few, and, after a little tinkering, it was put upon the road again. The sand had kept out the air, and prevented the iron from oxidizing."—*New York Tribune*.

A CURIOUS case of the invisible being photographed was when the "Great Eastern" was taken prior to her being broken up for good. When the photograph was made the photographer was not a little surprised to find great big letters extending the whole length of the ship advertising some one's patent pills. It appears that these letters had at one period of the ill-fated vessel's downward career been painted on as an advertisement. They had, however, been subsequently painted out with tar, and although invisible to the eye, the camera had detected and recorded them.

This seems improbable, but it is quite within bounds. When the letters were painted on the vessel's side they stood above the surface; any subsequent coat of paint would cover them and the ground beneath them equally, so that although in one color there would be projections which would catch the light and be photographed.—*The Engineer*.

**IN THE CALM THAT COMES AT EVENING.**

There's a calm that comes at evening  
When the weary day is o'er  
That's as soothing as the lullaby  
Our mother sang of yore;  
And though the day be dreary,  
I can just forget it all.  
In the calm that comes at evening,  
When the twilight shadows fall.

When I see my sweetheart's signal  
From her waving window blinds,  
I can feel her perfumed presence  
Wafted to me on the winds.  
Then I hush my heart to hear her,  
And I almost understand  
Her sweet welcome in the wimple  
Of the wind-wave from her hand.

When she laughs it's like the music  
Of the ripple on the rill,  
And her breath is like the perfume  
From the flowers on the hill.  
I dare not hope she loves me,  
But she tells me I can call  
In the calm that comes at evening,  
When the twilight shadows fall.

My life is like a stream of joy  
That swiftly rushes by,  
While I linger in the laughing,  
Luring luster of her eye.  
So my cate is in the corner,  
And my hat hangs in the hall,  
In the calm that comes at evening,  
When the twilight shadows fall.

—Cy. Warman.

**Pious Wisdom.**

A great many prayer meetings are prayed to death.  
Men who stamp around among the stars in the pulpit are not much account in helping people towards heaven.

No matter what you may say or think, if you know that your scales or measures are wrong, your heart is not right.

There are so many people who think they ought to help the Lord to keep the preacher humble.

There are spots on the sun, and yet there are people who expect a ten year old boy to be perfect.

If you want to make a boy work without knowing it, get him a safety bicycle.

No man can comprehend the divine character until he has the divine character.—*Ram's Horn.*

**The Depths of Ignorance.**

A young man who was a stranger in South Boston looked in vain for the Perkins Institute. Finally he said to a street boy:

"Kindly tell me the way to the School for the Blind?"

"Don't you know where the Blind Asylum is?"

"No; that's what I asked you."

Instead of giving the desired information the boy beckoned to an urchin on the other side of the street while he screamed at the top of his voice:

"Hi, Billy! Come over here! Here's a feller what don't know where the Blind Asylum is!"

**Did He Look Like It?**

The little boy had come in with his clothes torn, his hair full of dust and face bearing unmistakable signs of a severe conflict.

"Oh, Willie! Willie!" exclaimed his mother, "you have disobeyed me again. How often have I told you not to play with that wicked Stapleford boy?"

"Mamma," said Willie, wiping the blood from his nose, "do I look as if I had been playing with anybody?"—*Vogue.*

Charlie—Oh, I'm so dreadfully hungry! I believe I could eat my own head.

Clara—If you're so hungry I should think you would want something substantial.

**GRAND LODGE.**

**Assessment Notice for June.**

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND, June 1, 1894.

ASSESSMENT No. 46, \$2.00.

**To Receivers of Subordinate Lodges:**

SIRS AND BROTHERS:—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz.:

CLAIM No. 1274. Wm. H. Barrus, of Just in Time Lodge, No. 149, died of Pneumonia, February 12, 1894.

CLAIM No. 1275. C. F. Pillard, of Mt. Ouray Lodge, No. 140, died of Phthisis, February 12, 1894.

CLAIM No. 1276. Frederick Ross, of San Diego Lodge, No. 90, was killed in a Railway Accident, April 13, 1890.

CLAIM No. 1277. Joseph J. Fox, of Compound Lodge, No. 499, died of Apoplexy, May 8, 1893.

CLAIM No. 1278. Thomas J. Ames, of Rocky Mountain Lodge, No. 77, died of Duodinum, February 8, 1894.

CLAIM No. 1279. James W. Quinn, of Pacific Lodge, No. 173, was killed by Falling from Engine, February 26, 1894.

CLAIM No. 1280. John Martin, of Petroleum Lodge, No. 383, was killed in a Railway Accident, March 9, 1894.

CLAIM No. 1281. Daniel Adams, of Lake Erie Lodge, No. 241, died of Pulmonary Tuberculosis, March 21, 1894.

CLAIM No. 1282. Peter F. Kelley, of Enterprise Lodge, No. 75, died of Paralysis of Bladder, March 28, 1894.

CLAIM No. 1283. John Shanley, of Bluff City Lodge, No. 55, died of Consumption, March 30, 1894.

CLAIM No. 1284. E. E. Zeigler, of Truckee Lodge, No. 19, died from Surgical Shock, March 30, 1894.

CLAIM No. 1285. Charles Hilborn, of Chicago Belt Line Lodge, No. 331, died of Smallpox, April 4, 1894.

CLAIM No. 1286. Frank W. Sufer, of J. W. Walker Lodge, No. 381, was Caught in Brake and killed, April 5, 1894.

CLAIM No. 1287. Oliver Ferguson, of Summit Lodge, No. 87, was declared totally disabled by Injury to Spine, April 13, 1894.

CLAIM No. 1288. John A. Connors, of Protection Lodge, No. 137, died of Typhoid Fever, April 16, 1894.

CLAIM No. 1289. Wm. Reall, of Narragansett Lodge, No. 478, was declared totally disabled by Fracture to Leg, April 23, 1894.

CLAIM No. 1290. Wm. Becker, of Ozark Lodge, No. 280, was declared totally disabled by Loss of Foot, April 24, 1894.

CLAIM No. 1291. Charles J. Boylan, of Fellowship Lodge, No. 121, died of Concussion of the Spine, April 30, 1894.

An assessment of TWO DOLLARS (\$2.00) has been levied for the payment of the above claims, and you are required to forward said amount for each member whose name appears on the roll of membership MAY 31st, 1894 (also for all members having taken a withdrawal (limited or final) after MAY 1st, and for all members who died or were totally disabled since that date), said remittance to reach the grand lodge not later than JUNE 20th, 1894, as provided by Section 50 of the Constitution. Any lodge failing to make returns as above provided will stand suspended from all the benefits of the order, as per Section 52 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. & T.

Soap.**

It is not a fancy toilet soap—but a plain, every-day remedy for the mechanic, the busy housewife and the children. No household should be without it. Ask your druggist—he keeps it.

N. B.—Beware of vile imitations. Ask for and obtain

**GLENN'S SULPHUR SOAP**

Endorsed by Fairmount Lodge,  
No. 333, of the Brotherhood  
of Locomotive Firemen.

PHILADELPHIA, PA., April 6, 1894.

Mr. H. C. Reagan:

DEAR SIR AND BROS.:—We, as Fairmount Lodge, No. 333, of the Brotherhood of Locomotive Firemen, having carefully gone over the contents of your work on Locomotive Mechanism and Engineering, unanimously resolved—

That we tender our earnest congratulations to you, on this successful undertaking, and, as it fills a long-felt want among our class, we give it the endorsement and recommendation of this lodge.

Attest: H. E. STERLING, Master.

WM. H. ELLIOTT, Secretary.

**Locomotive Mechanism and Engineering.**

By H. C. Reagan. Explaining Fully and Clearly the Construction and Action of Simple and Compound Locomotives. Illustrating the principal "break-downs" which happen to a Locomotive, with Complete Directions what should be done when one occurs "on the road." Questions and Answers are so arranged that they can be used by Master Mechanics or Traveling Engineers, or by the Demonstrator in the Lodge Room. 145 illustrations. 300 pages. 12mo, cloth. \$2.00.

# Engineers and Firemen!

## STANDARD LITERATURE.

**These Books Will Help You to Master Your Calling and Get "On Top."**

**"Locomotive Catechism,"** by ROBERT GRIMSHAW. Nearly 400 pages. Full of cuts and illustrations. Fresh from the press and fully up to the times; **Price, \$2.00.**

**"New Catechism of the Locomotive,"** by M. N. FORNEY. More than 700 pages and more than 500 engravings. Greatest book published. **Price, \$3.50.**

**"Compound Locomotives,"** by ARTHUR T. WOODS. The only book on the subject. Should be in the hands of every student of the locomotive. **Price, \$1.**

**"Air Brake Practice,"** by J. E. PHELAN, of the Northern Pacific R. R. An exhaustive treatise on the Air Brake; explains in simplest language how to operate it under all conditions. **Price, \$1.00.**

**"Progressive Examinations of Locomotive Engineers and Firemen,"** by JOHN A. HILL. A capital little book for new beginners. An excellent pocket companion. **Price, 50 Cents.**

**"Alexander's Ready Reference,"** by S. A. ALEXANDER, for engineers and firemen. This book contains more valuable information in fewer words, and is easier understood by railroad men than any other book now in print. **Price, \$1.50.**

**"Twenty Years with the Indicator,"** by THOS. PRAY, JR., M. E. Copiously illustrated and containing many rules as to the best way to run any steam engine to get the best results. **Price, \$2.50.**

**"Simple Lessons in Drawing,"** by ORVILLE H. REYNOLDS (Chief Draftsman, Northern Pacific Railway). A splendid book. Every student of locomotive engineering and every explorer in the field of mechanics should have it. **Price 50 cents.**

**"Roper's Hand Book of the Locomotive,"** by STEPHEN ROPER. One of the most valuable treatises ever written on the subject. It is fully illustrated, and contains a description of the most approved locomotives in use. **Price, \$2.50.**

**"Locomotive Running Repairs,"** by L. C. HITCHCOCK. A splendid little book for locomotive men. **Price, 50 cents.**

Do You Want a Picture of the

## FAMOUS "999" LOCOMOTIVE?

We've had hundreds of letters asking for a picture—now we have it. Something better than a photograph. A **transparent**, copper-plate engraving of the famous flyer; you can see everything **outside** and **inside**. Every part is numbered and named. Fit for a gold frame in a palace. Printed on satin gloss paper, 14x28, and mailed in a tube (without folding) for 50 cents (stamps are good, but we would rather have postal notes or money orders). This is an educational device, up to date, unique, beautiful and correct. Once seen, no other picture of this beautiful locomotive will satisfy you at all. Send cash with order. **LOCOMOTIVE ENGINEERING, 5 Beekman St., New York City.**

If you are a subscriber, for 1894, to our paper, **Locomotive Engineering**, you get the above picture and our other little school masters, the **Traveling Engineer's Examination Chart** and the **Working Model of the Triple Valve**,

► **FREE.** ◄

The paper has over 40 large pages and is the best illustrated and "**most interesting railroad paper published.**" Practical, instructive, interesting! No engineer, fireman or shop man can afford to be without it. Sent to any address in the world for \$2.00. Angus Sinclair and John A. Hill, Editors. Specimen Copy, free. Address

## LOCOMOTIVE ENGINEERING,

256 Broadway,

NEW YORK CITY.

# IMPORTANT.

In view of the present uncertainty of business, we have decided to offer the two works of Professor N Hawkins upon easy and liberal terms of payment to the patrons of the FIREMEN'S MAGAZINE and others, who will furnish a reference as to reliability, i. e., part of the cost with the order when the books will be sent, and balance monthly.

It is a proverb that "he stands strongest who stands on his head"—this has been well illustrated in the case of the owner of these two books. In the numerous changes which have taken place in the past half year, and which are still going on, the practical knowledge which has been acquired from the Hawkins works has enabled many of their possessors to hold over in good positions where others have been forced to resign.

The "Hand-book of Calculations" (now selling in its seventh thousand), and the "Maxims and Instructions for the Boiler Room" (now selling in its third thousand), are educational works of the rarest value, and have already, in scores and hundreds of instances, proved the stepping-stone for permanent advancement (Firemen to be Engineers, Engineers to be Superintendents, etc.).

The "Calculations" teaches first, the principles on which steam-engineering is founded, i. e., mechanical philosophy, and beginning with the figure one, proceeds with rules, examples, and plain directions to the most essential problems relating to steam-engineering.

The "Calculations" teaches first, the principles on which steam-engineering is founded, i. e., mechanical philosophy, and beginning with the figure one, proceeds with rules, examples, and plain directions to the most essential problems relating to steam-engineering.

The "Maxims and Instructions" teaches how to "fire" with all kinds of fuels and the different varieties of boilers; gives details of construction and dimensions of boilers. It deals with the details and management of pipes and piping, steam-pumps, injectors, tanks, steam-heating, plumbing, etc. The book has hundreds of definitions and illustrations of appliances used in and about the boiler room.

These books are each provided with a ready reference index, which renders their hundreds of practical suggestions instantly available; hence they are works of both instruction and reference.

These two books are each strongly and handsomely bound in green cloth, with gold titles; they weigh over five pounds for the pair and are almost a library in themselves. The price is \$5.00 for the two, and \$2.50 for a single volume, post or express prepaid to any part of the world.

Parties wishing them on "part payments" will be informed of the terms upon application. Club rates also given on application. Correspondence solicited. We furnish a descriptive catalogue free.

**Theo. Audel & Co.,**  
PUBLISHERS.

Office 3. 91 Liberty St., N. Y.

P. S.—Very many Master Mechanics of railroads have bought the pair of these "noble books" and found them exactly adapted to their department of railroad service.

## MILLION FOR A "CURE."

**DRUGGIST SCHRAGE SELLS A SECRET COMPOUND TO A SYNDICATE.**

It is a Remedy for Rheumatism That He Has Been Working on for Years and Has Now Brought to a State of Perfection—The Syndicate is Given the Exclusive Agency, but the Druggist Retains His Secret—Names of the Buyers Not Given.

Frank Schrage, a North Clark street druggist and the discoverer of what he claims is an infallible specific for rheumatism, sold the exclusive agency for his remedy yesterday to a syndicate of Chicago people for a large bonus and a large royalty. It was reported that the bonus was \$1,000,000.

For this complete story see the "Chicago Tribune" May 3. It was also published in the "Chicago Times," "Post," "Staats Zeitung," "Fraie Presse," "Philadelphia Presse" and many other leading papers.

It has never failed yet. Does it need any argument to prove that a syndicate did pay \$1,000,000 for a "fake?" Other people are cured, you can do as you please about trying it. The demand comes in faster than we can make it now. Only small orders received. Price, \$1.50 a bottle at Chicago. Book of Testimonial 1c. by mail.

# PERFECT RAILROAD WATCHES

HIGHEST GRADE

ROCKFORD

WATCH CO.

15 JEWEL

MOVEMENT.

GUARANTEED

TO PASS

RAILROAD

INSPECTION

**COSTS NOTHING  
TO EXAMINE.**

**Jos. Fahys & Co.'s "Montauk,"** dust proof, open face case, 10k gold filled, screw back and bezel, neatly and artistically engraved, and accompanied by the manufacturer's signed guarantee to wear for fifteen years. Fitted with No. 87 Rockford movement as described below,

**\$22.50.**

**American 14k Gold Filled Hunting Case,** elegantly engraved and finely finished, and accompanied by the manufacturer's own guarantee to wear for twenty years. Fitted with No. 84 Rockford movement as described below,

**\$25.15.**

The No. 87 Open Face and No. 84 Hunting Movements are the highest grade 15-jeweled movements made by the Rockford Watch Co. They have fifteen finest ruby jewels, in solid gold settings, Breguet hair-spring, patent micrometer regulator, fancy or double sunk dials, and are elegantly damaskeened in gold on solid nickel. They are fully adjusted to heat, cold and positions, will pass railroad inspection, as they comply with the requirements of railway time orders, and are acknowledged the best movements ever offered for the money.

With each movement is sent a signed and numbered guarantee and our agreement to clean and oil movement once a year for five years from date of purchase.

For the benefit of those who do not wish to purchase higher priced cases, we will furnish these movements in **Dueber Silverine Cases** at the following prices: No. 87, \$15.95; No. 84, \$16.00, and will allow a credit of 75 cents for the open face and \$1.25 for the hunting case (when returned) on any purchase of a solid gold or gold filled case for the movement made within one year..

Samples of these watches can be seen and purchased for above prices at any Express Office in the United States. If the agent of the express company doing business in your town has not samples on hand, write us, giving his name and name of the company, also stating which watch you wish to examine, and we will at once forward samples for your inspection. If the watch is satisfactory, pay the agent our price and he will deliver it to you, otherwise you do not pay a cent.

SCIATICA AND RHEUMATISM.

## "PULL YOUR LEG"

Is less to fear with Railroad men than to Lose Your Leg. In the latter case you surely want to replace it with a Patent Adjustable Slip Socket. Warranted not to Chafe the Stump. Received the Gold Medal and the Diploma at the World's Fair.

LARGEST FIRM IN THE UNITED STATES.

The Inner Socket, seen outside the limb in cut, is made over a plaster cast of the stump, giving an exact fit, being held permanently upon the stump by elastic fastened to lacer above, and in act of walking moves up and down in the outer socket, bringing all the friction between the two sockets, instead of between the stump and the socket as is the case of all wooden socket limbs. With our SLIP SOCKET the most tender, sensitive stump can be fitted and limb worn with perfect ease and comfort. Endorsed and purchased by United States Government. Send for our New Catalogue with Illustrations

The Pocahontas Coal is acknowledged by all railroads that have used it to be the best American coal for Locomotive use. It generates steam with great rapidity, and at the same time holds the fire an unusually long time. The merits of the coal are shown by the unprecedented growth of the mines, which were not opened until 1883. Since that time the out-puts have increased over 1,200 per cent. beyond all precedent, amounting during 1892 to 3,000,000 tons. During the present year it will be at least 2,000,000 tons. We are therefore prepared to fill all orders with prompt dispatch.

# Galena Oil Works, Limited

## FRANKLIN, PA.

## SAFETY, SPEED, ECONOMY

Are the results of the use of Galena Oils. Scientific and practical tests of the past twenty years have  
 strated the fact that Galena Oils are superior to any other oils in the market.

Galena Oils in winter stand a cold test of from ten to fifteen degrees below zero, and will not freeze  
 coldest weather.

The superiority of Galena Oil is demonstrated by their exclusive use upon a large majority of the r  
 of this country. They are in use upon three continuous lines of railways from Boston and New York  
 Pacific coast and on one to the City of Mexico, thus demonstrating their adaptability to all clima  
 all temperatures.

We also supply our patrons with Sibley's Perfection Valve Oil, which is in exclusive use upon a lar  
 tory of the leading railroads of the country.

## APPLICATION OF THE SOCIALISTIC THEORY OF VALUE.

BY WILFRED P. BORLAND.

"The proof of the pudding lies in the eating of it." The test of a theory lies in the application of it. I am unable to dignify Mr. Stuart's peevish and incoherent attack on my article which appeared in the April number of this MAGAZINE, by calling it criticism. The splenetic and fault-finding tone in which he imputes to me improper motives for refusing to look at social questions through the same colored glasses as himself, I cast aside, as being not only unworthy of attention but entirely out of place in an argument calculated merely to establish the truth or error of an economic principle. The task of discrediting the socialistic theory of value is certainly not a "hopeless" one, as socialists themselves have discredited it in cases too numerous to mention; and there is not a single organic development of Marxian, or democratic, socialism in existence to-day wherein the theory is not distinctly discredited. Dr. Albert Schaffle, a very much better informed socialist than Mr. W. H. Stuart, says that "without considering the varying use-value of different labor and different products, it is impossible to conceive a socialistic estimate of value which could take the place of the present market value as contemplated by normal political economy." And he further says that "the bare labor-cost value, as it has been formulated up to now, invests the whole economy of socialism for the present with the character of an Utopia." In truth Karl Marx lays down too marked a distinction between use-value and exchange-value. The two sorts of value are, of course, quite different; nevertheless, they are inseparably connected as properties of the same body, and, although it is possible to separate them by means of an arbitrary mental process, it is not possible to do so when considering the actual function of the

two sorts of value as properties of commodities circulating throughout the social organism.

Marx contends that commodities, considered merely as commodities, have no use-value, but merely have exchange-value. But this is entirely too marked a distinction, since it is utterly impossible for an object to become a commodity, to acquire exchange-value, unless it is also an use-value; and the moment it loses its property of use-value it loses also its property of exchange-value, it ceases to be a commodity. The two properties are so intimately related to each other, although so entirely different, that it is impossible to either destroy or create the one without destroying or creating the other also. We may illustrate the subject by means of an example drawn from the physical properties of matter. All bodies have two properties which they hold in common—weight and extension. These two things are quite different—weight is one thing, extension is another—yet they are so intimately connected as properties of the same body that it is utterly impossible to separate them, except by means of an arbitrary mental process which bears no relation to the actual fact and which is utterly valueless in practice. We cannot destroy or create the property of weight in a body without also destroying or creating the property of extension. We cannot create or destroy the property of extension without also creating or destroying the property of weight; nor can we *actually* think of these two entirely different properties as existing apart from each other in the same body. Thus it is with commodities. They have two properties which enter into the composition of their value-form. These two properties are quite different, yet they are so intimately connected that it is utterly impossible to consider them as existing apart from each other, except by means of a sort of mental process that is wholly useless in the presence of the facts.

Mr. Stuart says: "Admit the claim (labor produces all wealth) and it follows logically and inevitably that labor is entitled to the whole product." Quite true; neither the truth of the proposition nor its logical consequence is denied—by me, at least; and when Mr. Stuart answers me as if I had denied it, he either does not understand the theory which he affects to believe himself, or he imagines that I do not understand it. But I would wish Mr. Stuart to know, right here, that I am not a child who rushes into the discussion of a question without having studied it sufficiently to obtain a fairly clear conception of its various bearings, and that when I enter into a controversy of this description I know enough about my subject to discuss it *on its merits*, and on its merits alone. The proposition that "to refute Marx's theory of value, it must be shown that in the production of wealth there are other factors besides nature and human labor," is not true, since the theory of value is calculated to secure harmony in the *distribution* of wealth rather than in its production, and it does not logically follow from the proposition that "labor creates all wealth." Mr. Stuart has, here, either fallen into the very common error of transposing the terms "wealth" and "value," or he imagines that I am so poorly equipped for the discussion as to permit myself to be betrayed into the silly fallacy of answering to the wrong point. The two propositions which lie at the bottom of modern scientific socialism are: 1. "Labor creates all wealth." 2. "Labor-time is the absolute measure of value." The first of these propositions I admit without question; the second, I deny. It follows from the first proposition that the individual is entitled to enjoy the full benefit of the wealth which is the product of his labor, including, of course, its exchange-value. Proceeding from this impregnable position, Marx regards the production of wealth as a collective, or social process, and he seeks a rule by which to apportion to the individual producer his full share of the product of the collective industry. This rule he finds in his theory of value. Analyzing commodities, as they present themselves fresh from the capitalistic labor process, he finds that, as values (that is to say, in their character of commodities) they present the one common feature of being products of labor, and that their magnitude of value is directly proportioned to the duration of the labor process from which they have issued. From this fact he deduces a rule of distribution. Accepting the duration of the labor process as the absolute measure of the exchange-value of its product, and extending the rule universally, he gets the theory of value, by which the value of the service which the individual has contributed to the process of production is determined

and his just portion of the product indicated. So far, good; we may proceed now to the application of the theory. But, first, let me call attention to the fact that the burden of proof rests on the socialists, on those who affirm the truth of this theory of value; they must show that the application of the theory is competent to apportion to the individual the full and actual product of his industry, or the full and actual equivalent thereof. When they do this the theory is proved, and until they do it, the theory is debatable. The rule of distribution promulgated by authoritative communism was a thoroughly arbitrary one. The individual was repressed; his actions were governed entirely by an authority superior to himself; the thoroughly free movement of the individual producer was neither contemplated nor allowed; the individual was regarded as a mere cog in the social machine, fitted into his place by a superior power, and allowed such portion of the product of the collective industry as answered for the satisfaction of his wants, or, rather, his needs, as determined also by a superior power. This theory is dead. Humanity has outgrown it. Scientific socialism has taken care not to commit itself to any such vagaries; it seeks at all points to avoid the manifest difficulties in the programme of authoritative communism. Instead of repressing the individual, it seeks to free him from repression; instead of fitting him into his place by means of superior authority, it pronounces his absolute right to exercise the privilege of a free man and find his own place to suit himself; instead of declaring that he shall share in the product of the collective industry in accordance with his pre-determined needs, and without reference to his effort, it declares that he shall share in such product strictly in accordance with the value of his effort; it declares that he shall be permitted to enjoy the fruits of his own industry, and of his own industry alone; it apportions to the individual that part of the collective product which answers to correspond with the value of the effort he has contributed to the process of production, and that part alone. Scientific socialism *does not* enforce equality of material condition, nor declare an equal apportionment of products; it *does* declare that the individual shall have what he produces, and that there shall be equal rewards for equal service. With this understanding of the subject, we may proceed.

As the substance of value is human labor, and as, according to the socialists, the substance is measured exactly by the duration of labor, it follows that the value of labor is invariably and certainly reflected in its product; and it is logically certain that products requiring equal quantities of labor have equal value, and that the labor itself

is entitled to equal reward. This puts out of sight the question of utility. Everything works well up to this point; but right here we run foul of the question of *economic motive*, and the socialists discover that there is an element of value which has not entered into their calculations and which renders their theory practically worthless. Man seeks to satisfy his wants with the least exertion. There is a fact of human nature that can never be put out of sight. As, in a correct social state, man can satisfy his wants only by the exercise of labor, and as the perfectly free individual will always satisfy his wants in the easiest manner that presents itself to his view, it is absolutely certain that when the reward of labor is estimated wholly by the duration of its function, men will gravitate towards those occupations whose character is of a nature to permit them to obtain the reward in the easiest manner. As, for instance, the individual will not work during ten hours at ditch digging, or at quicksilver mining, or at the many other highly laborious and repugnant, though socially necessary, occupations, when his ten hours' labor exerted in these occupations creates no more value and receives no more reward than would his ten hours' labor when exerted in the many more agreeable occupations which he is at perfect liberty to enter. The application of the theory of value at once destroys the economic motive, necessary to the free movement of individual producers, and creates disharmony in the economic arrangements of the social body. We have a glut of laborers here, a scarcity there; a superabundance of certain products, an absolute dearth of others. How to secure harmony, how to introduce the motive necessary for the maintenance of equilibrium in economic forces—that is the question. The communists made short work of this matter, since they did not admit the necessity of a motive in the individual; they secured harmony by simply ordering the individual to his place and keeping him there by the force of authority. But the socialists are not allowed to do this. They scornfully reject such measures as tend to enslave the individual and interfere with his thorough liberty of action. They, therefore, find themselves, when they enter into the development of an organic programme, cast upon the horns of a dilemma. They must either accept the doctrine of communism, and employ force to secure harmony, or they must discredit their absolute theory and proceed empirically. The latter horn they accept. They readily recognize the difficulties of the situation, and they attempt to remove them by decreeing differences in the duration of the labor day for the different occupations as an inducement for the workers to freely distribute themselves in a proper

economic ratio throughout the arena of social production. They decree, for instance, that one hour's labor devoted to certain repugnant tasks shall be equal in value to two or three hours' labor devoted to other more pleasant tasks, and shall be rewarded accordingly. The moment this principle is admitted, the theory of value falls to pieces. It is obvious that labor-time is no longer the measure of value; the logic of fact has forced the recognition of *utility* as an element in the composition of value. The socialists are at once deprived of their absolute rule; they find themselves launched upon the boundless sea of empiricism, and the organic development of scientific socialism issues in just such fantastic arrangements as those which nationalism presents to our view. Just how it is possible for a believer in Bellamyism to enter the lists in defence of Marx's theory of value is one of those things that are past finding out. The logical processes of such a person are, to say the least, peculiar, as nationalism is a *non sequitur* conclusion. I do not know that it is necessary for me to say anything further concerning the theory of value, in the present article, but it is pertinent to ask: Would the workers in the socialistic state be liable to always understand and appreciate the value of the statistics which empowered a social functionary to say to one laborer "here is a note for ten hours' labor," and to another who had worked during exactly the same time, "here is a note for five hours' labor?" Such questions as this relate to essential points—points that are vital to the harmonious working of the socialistic theory. They cannot be disposed of by bluster and mere scolding, but must be discussed candidly and in the calm atmosphere of reason. Some socialists, like Schaffle, have frankly admitted the inaccuracies in the socialistic theory and have set themselves honestly to work to correct them, and I may say with truth that no person would hail the success of their effort with greater satisfaction than myself. When I am accused of "eagerness to make a point against socialism," my accuser simply does not know what he is talking about. I care nothing about socialism, nor any other theory; I am not a theory monger in any sense of the word. The only thing I am interested in is the attainment of absolute human liberty. I follow theories only so far as they tend towards liberty, and no farther; if socialism can guarantee my liberty, and that of my fellow men, I am a socialist; otherwise, not. Names cut no figure with me; it is things I am after. I am a single taxer because I believe it will give me and my fellows a greater measure of liberty than any programme at present attainable, and let it be understood, now and for all time, that human liberty is so grand, so divine, so sublime a principle

that it must not be sacrificed to the necessities of any theory on earth, no matter by whom it is promulgated. Socialists who accept the dogma that all sociologic and economic knowledge resided in the brain of Karl Marx, and died with him, are seldom in a frame of mind to discuss social questions as they ought to be discussed, reasonably and candidly. They appear to proceed upon the hypothesis that all persons who do not accept their means are opposed to their ends; that those who fail to put their trust in socialism must necessarily be in favor of capitalism. If one ventures to point out defects in socialism, he is at once assailed as either a knave or a fool, and, by the bitterness and truth of their criticisms of the present system, the socialists attempt to obscure the issue and envelop their unlucky opponent in a cloud of dust. Such tactics will answer to squelch some persons, but in dealing with one who has made an honest and searching study of sociology, and who has earnestly studied socialism from many points of view, with the object of understanding it, they will not answer. Socialists of this description have some things to learn yet, which it would profit them to learn quickly. They should learn that clear and incisive criticism of the present system, however true, does not establish the truth of socialism; that when the defects of capitalism are shown, it does not necessarily follow that the perfection of socialism is proved beyond question. They should learn that when Peter is proved to be a bad man it does not necessarily follow that Paul is a good one. They should learn that there are some persons outside the ranks of the socialists who are possessed of a modicum of exact knowledge concerning social questions, and who have acumen enough to properly use it; and they should learn that there are many persons, who are by no means fools, who oppose socialism from thoroughly honest and conscientious motives. Now, I may say a few words concerning Mr. Stuart's impotent attempt at criticism.

Some of the illustrations which I employed in my April article were far-fetched, but they were used to establish the place of utility in the composition of value, and it is sometimes well to use a far-fetched illustration in order to bring a fact prominently into view. The character of the illustrations did not affect the fact which they established: the illustrations were non-essential, the fact is essential; and it will be observed that while Mr. Stuart has something—not much—to say about the non-essential, he is most industriously silent concerning the essential. The religious question may be permitted to rest where it is, since any further discussion must turn merely on matters of opinion, and I am willing to let such

authoritative utterances as I have already produced—and I could produce many more—go for what they are worth. But I do wish to say a few more words concerning the Mormons. When Mr. Stuart excuses the persecution of the Mormons because it was undertaken on moral grounds, he furnishes me with evidence that persons or sects would be just as liable to suffer such persecution under socialism as they are to-day. This argument of morality has been used as a specious pretext for religious persecution in all ages of the world, and, with respect to its application to the Mormons it is one of the baldest pieces of hypocrisy that could well be imagined. I am in a position to say something on this question from the standpoint of personal observation. About fifteen years ago it was my fortune to be domiciled for a time in a community of Mormons in the territory of Arizona. These people were polygamist, but a more industrious, frugal, temperate, honorable, and thoroughly moral community of persons it has never been my fortune to enter. At that time I enjoyed some slight personal acquaintance with Mr. John N. Young, a son of Brigham, a polygamist, and those railroad men who may chance to remember Mr. Young as a contractor engaged in the construction of the Atlantic and Pacific railroad will bear me out in the assertion that a more upright, conscientious and moral gentleman than he was conceded to be, even by the Gentiles, would be hard to find. Although, when originally promulgated by Joseph Smith, the Mormon belief did not enjoin the practice of polygamy, it came later on to be adopted as an integral part of the Mormon religion, and when their persecution was undertaken on moral grounds polygamy was one of their most essential articles of faith; they sincerely believed it to be right, and they had a perfect right to practice it without interference from others as long as they held that belief. All the Mormons asked was to be let alone; they migrated into the desert to escape persecution, and by their industry, frugality and temperance, they created an Empire and made the desert to blossom like the rose. They became wealthy, attended to their own business, and were a happy and contented people. Then the Gentiles, casting covetous eyes upon the Mormon wealth, raised their hands in holy horror at the practice of polygamy, and instituted a persecution on moral grounds for the sole purpose of filling their pockets with wealth which was the product of others' industry; and their misguided followers, as is always the case, entered with enthusiasm into the iniquitous schemes of their leaders under the belief that they were engaged in a great moral reformation. Two-penny orators, whose moral perceptions might have been

buried from sight under the point of a pin, entered the crusade and hurled thunderbolts of rhetoric against practices and beliefs about which they possessed as much meritorious knowledge as they did of practices and beliefs carried on among the inhabitants of the planet Saturn. We are told that the practice of polygamy is one that "all civilized nations are opposed to, both Christian nations and those that are indifferent or hostile to religion." Suppose we admit that as true, which it is not, in what way does it justify the persecution of the Mormons? When a community of individuals, sincerely believing in polygamy, attempt to live out their belief, whose business is it but their own? Why should they be forced to adopt the beliefs of others in deference to moral sentiments which they do not accept themselves? As long as they attend to their own business, and live out their own beliefs, why, in the name of God, should they not be let alone?

The Perfectionists were also persecuted on moral grounds, but it would much profit those who have hastily accepted, and parrot-like repeated, the arguments against this sect, to read the writings of John Humphrey Noyes, a cultivated gentleman, the founder of the Perfectionist sect. They may there catch glimpses of elevated moral sentiments which will come as a revelation to them. They may contemplate a scientific doctrine, founded on moral considerations of the very highest character, and which issued in happiness and contentment to a considerable community of people, of much more than average intelligence and education, until they were pounced upon by a horde of pseudo-moralists and forced to renounce their belief. In the name of all that's holy! who set these great moralists up to be judges over the social and religious beliefs and practices of their fellow men? From whence comes their authority? That is the baldest fallacy that ever afflicted the human race which enables a majority, however large, to force its opinions and beliefs on a small minority; which sets up and maintains an universal moral code by the force of law. Liberty cannot be maintained when such principles are admitted. Such principles involve a transposition of the terms, right and wrong.

With regard to the orthodoxy of the different exponents of socialism, the matter may also be permitted to rest, as being a non-essential point, and not to be settled by opinion; but I may be permitted to remark that I have some knowledge of socialistic literature, and I would suggest, if the fact is as stated by Mr. Stuart, that the various sects of socialists follow out one of their strongest common principles, and get together.

Mr. Stuart wants me to "kindly explain

why the elimination of private capital would make any change in majority rule?" I cannot attempt to explain any such proposition as that, as it is one I have never advanced. I do not believe that the elimination of private capital, as contemplated by socialism, would make any change in the principle of majority rule, and that is just the reason why I oppose the massing of all productive capital under collective control and management. Collective control under democracy, necessarily means majority control, and while the national administration of capital would effect no change in the principles of majority rule, it must give such rule a new direction. Majority control of capital means majority power to direct the uses of capital, and the ends for which it shall be administered. It means a power lodged in the hands of a majority to dictate what forms production shall take, what things shall be produced and what shall not be produced. It means an immense power, the power to say what certain persons shall eat, drink and wear, lodged in the hands of the majority, which may or may not be used as the majority happens to feel about the matter. There is some escape from such contingencies as this while private capital is allowed to exist, but when it is once eliminated there is absolutely no escape. The minority must then cut their coats to suit their cloth, whether the material happens to suit them or not. It seems to me that there is no more self-evident proposition than that.

### SINGLE TAX ECONOMY.

BY W. H. STUART.

In the course of my polemic against the single tax I have, I believe, thoroughly exposed the fallacy underlying the single tax assumption that mere access to natural opportunities would solve the economic problem. I have shown that under present conditions of production, by the aid of costly labor-saving machinery, and the use of immense capital, mere access to land and natural resources to a man without capital would be a hollow mockery. As a complete *non sequitur* to the single tax argument I have more than once referred to the thousands of abandoned farms of the New England states. Hundreds of those farms, with substantial improvements, have been offered for less than the cost of the improvements. Hundreds of others have been offered for the mere agreement to pay the annual taxes. There were at one time nearly four thousand of these abandoned farms. Hundreds of them within sight and sound of the New England factories, yet there is no evidence on record of a factory employe having ever taken advantage of this "free access to natural resources" as

an alternative against accepting any "reduction" offered by the capitalist owners of the factories. Now, this fact is totally at variance with the single tax theory which holds that with free access to "the margin of cultivation," i. e., to land of no rental value, capitalist exploitation would be impossible; that in those halcyon days, instead of employes seeking employers for a chance to work, employers, on the contrary, would compete for laborers and that through such competition labor would get its full reward, and involuntary poverty be forever abolished. But strange to say, the factory employe has hunted employers as assiduously as ever, and he has ever been willing to accept "a reduction" in preference to starving on the free land near him. This upsets the whole single tax theory.

In my May article I referred to the fact that my single tax opponents never answered this argument. However, I can no longer taunt my opponents with their reticence and reserve in the premises, for in the June MAGAZINE Mr. W. E. Brokaw, the editor of the St. Louis *Courier*, the official single tax organ, shies his caster into the ring, and with the confident air so characteristic of the orthodox single taxer whose knowledge of economics is usually confined to the few borrowed platitudes found in "Progress and Poverty," comes to the rescue, spits on his hands and asks the bystanders to "watch me do him up. See?"

Mr. Brokaw says:

In your May number, W. H. Stuart makes a lopsided argument against the single tax, and then says: "My single tax opponent never answers this argument." What is his argument? Simply that farmers cannot now compete with capitalists, and have abandoned farms in sight of factories, and that "all the advantages to be derived from improved tools, machinery or other capital would go, as now, to the capitalist." This latter is an unsupported assertion which he cannot prove. The reason why not only farmers, but other laborers, cannot make a living on those abandoned farms, and barely exist elsewhere, is because everything they consume or produce is taxed—their industry fined, while the speculator in land is almost exempt.

All of which goes to show how entirely superfluous brains and intelligence are to the editor of a single tax paper, and how thoroughly well qualified Mr. Brokaw is for the position.

Let us see. Mr. Brokaw starts off rather incoherently. He asks: "What is his argument?" and answers, "Simply that farmers cannot now compete with capitalists, and have abandoned farms in sight of factories." I fear Mr. Brokaw wrote under great mental excitement. I feel quite positive that I never gave as a reason why "farmers cannot now compete with capitalists" was because they "have abandoned farms in sight of factories." Of course no farmer could expect to compete if he had abandoned his farm, whether it was in sight of a factory or not. Why in the world

didn't he stop on it? Ah, there is the rub! Here is where Mr. Brokaw gets in his fine work. Here is where he puts to shame my former opponents, who will be covered with confusion when they see how simple the answer is that they missed. The reason, says Mr. Brokaw, why the farmers could not make a living on those abandoned farms and why they barely exist elsewhere, is "because everything they consume or produce is taxed—their industry is fined, while the speculator in land is almost exempt." There it is, as clear as mud! Now, would Mr. Brokaw kindly explain why it was that when "Progress and Poverty" was written the New England states were settled by a prosperous and contented agricultural population, when land was worth an average of \$40 per acre, and when the cereals were grown with profit. Genesee wheat, raised in Genesee county, New York state, was known all over the union for its superior quality, yet in less than a decade the agricultural areas of the New England states were almost depopulated, the same system of taxation being in effect. Is Mr. Brokaw so ignorant of recent economic changes as not to know that the result was due solely to the competition with the machine worked farms of the northwest? That on the level plains of the Dakotas machinery could be used to such good advantage that they could produce the cereals at one third the cost of the New England farmer, who was, in consequence, driven to the wall and forced to abandon his farm from sheer inability to compete?

Will Mr. Brokaw also explain why the "bonanza" farmer of the northwest and the valleys of California made agriculture pay, notwithstanding the fact that "everything they consume or produce is taxed?" Does he not know that the World's Fair commissioners were shown a wheat field of 7,700 acres in Dakota, where the wheat was produced at a net cost of 33½ cents per bushel, so that at 50 cents per bushel it paid a profit of 33½ per cent.?

Here is another case: At a recent single tax meeting that I attended in this city, one of the speakers was strongly insisting, as usual, that free access to land would make the man without capital economically independent, and that "the single tax would do it." At the conclusion of the speech a gentleman in the audience arose and stated that he knew two men who had taken up government land in the state two years ago. This land not being patented they had no taxes to pay. They put their land in wheat for two seasons, had good crops which they sold for an average of 50 cents per bushel. The first season they lost \$400 and the last season \$800, and yet within a few miles of those farms were immense wheat fields that had been plowed by trac-

tion engines with a dozen plows attached, that plowed the land at a cost of 25 cents per acre; where machines costing several thousand dollars each, combined headers and threshers, that went into a field of ripened grain, cut it down, threshed and sacked it at the rate of four sacks per minute, at a cost of three or four cents per sack. This wheat was sold at a profit for 50 cents per bushel. The single tax speaker was asked how much better off those two men would have been under the single tax régime? After a hurried consultation among the "economists" one of them arose and stated that with the adoption of the single tax free trade would obtain, and that the two farmers referred to would have saved all their indirect taxes, and as the government would own the railroads they would be able to ship their grain to market cheaper. But as the bonanza farmer would also share in the diminution of taxes and transportation charges, would not the small farmer be under the same relative disadvantage as before? The single tax "economists" have never been able to solve the problem. They nevertheless keep on repeating the same old stale platitudes with "damnable iteration." They are as blindly ignorant of the real solution as Editor Brokaw is. It is painful to an intelligent student of economics to hear those people diagnose social conditions like experts, and then afterwards hear them prescribe like veritable quacks.

Can not even a single taxer see that under present conditions of great aggregations of capital, carrying on production on a gigantic scale, makes it utterly impossible for the man without capital, or even the man with moderate capital to compete in production? Even a single taxer will admit that it would be impossible for a hand loom weaver to compete in cost of production with the owner of the power loom and the steam engine. No more can the ordinary farmer compete with the bonanza farm of 10,000 or 100,000 acres, supplied with all the latest labor saving machinery. The capitalist mode of production is as inevitable in agriculture and horticulture as it is in manufacture. Nothing can be more certain than that in less than a score of years small farming will be as obsolete as the stage coach and the tallow dip.

It is the merest effrontery for an ignorant doctrinaire to tell an intelligent audience that "The reason why not only farmers, but other laborers can not make a living on those abandoned farms, and barely exist elsewhere, is because everything they consume or produce is taxed—their industry is fined while the speculator in land is almost exempt."

In view of the facts I have just cited, and many others which I have offered in previ-

ous numbers of this MAGAZINE in the discussion of single tax fallacies. Mr. Brokaw's "defi" to "Mr. Stuart or any one else, to show how, with such a land tenure system in America, capitalists or any other class could dictate wages or keep men out of employment who desired to work." I have discussed this subject pretty thoroughly in this MAGAZINE with much abler opponents than Editor Brokaw, but if Mr. Brokaw is in earnest in his "defi," and will open the columns of the *Courier* to a discussion, I will agree to prove that the single tax theory is based on ignorant assumptions and shallow economic fallacies. Does Editor Brokaw accept? I may mention that a similar public challenge to our local single tax club has been declined, and I have been notified that the only proposition they will consider is an offer to prove that "the single tax would be no improvement whatever over existing conditions." For fear it may be assumed that the club is composed of a few workmen, new converts to the single tax, and therefore diffident about entering a public discussion, I will state that the personnel of the club consists of half a dozen lawyers, some of whom have been single taxers for years, several other professional gentlemen, a millionaire capitalist or two, and a very small contingent of men who earn a living by the use of muscles, other than their jaws. The whole very respectable "aggregation" is presided over by a gentleman who has fought under a variety of flags, both political and economic, who is careful to announce at each meeting that no "discussions" will be allowed, but that sincere seekers after economic truth may ask questions, which one of the "lawyers" usually answers, and who discourages the use of technical terms by questioners. I remember asking the president a question in which the term "margin of cultivation" was used, and was severely taken to task for using obscure terms designed to befog the meaning. He is also, together with the club, in entire sympathy with the desire to "lift the movement out of the howling dervish state of emotional insanity" into the sphere of practical politics (with big p's.) They are careful to disavow any sympathy with "socialism or communism." "The Single Tax as a Fiscal Reform" is the only point of view from which they desire to discuss it, and only the occasional question of a "crank" forces them to acknowledge that the "movement" at one time meant something more. They are profuse in their protestations that "the millionaires have nothing to fear from us." They regard the millionaire using his capital for productive purposes as "a public benefactor," of whom they cannot have too many to help develop the resources of the country (?) They are bitter opponents of

anything in the shape of an income tax, which they denounce as the "robbery of labor (?)." Indeed, they are a thoroughly practical and highly "respectable" body of gentlemen, with "no nonsense" about them, who are not single taxers exclusively "for their health."

But to return to Bro. Brokaw. He assures us there is no other way by which a man can secure his rights to the use of the earth than by the adoption of the single tax; he assures us the veriest savage under such conditions of freedom "could soon amass great wealth independently of all 'capitalists' producing their own capital." Bro. Brokaw's assertions have the airy abandon and breeziness of our western prairies. But I imagine if I had him under fire for a few months he would gradually fall into a more careful and guarded mode of expression. Just now he feels like the champion checker player of a country village. He wonders if there is a man in the world who can beat him!

Mr. Brokaw says: "Whether Mr. Stuart has ever been answered in your columns or not, I do not know." By which, of course, he means answered in regard to the abandoned farms. Well, no; I haven't. My opponents were too intelligent to offer so frivolous a reason as he has done. They knew there was no intelligent answer that a single taxer could make to the question, so they wisely decided not to draw attention to the weakness of the single tax by discussing it. I venture the assertion that Mr. Brokaw will be inclined to follow their example in the future.

"But," continues Mr. Brokaw, "he has been answered from the platform in his own city of Los Angeles, where he willfully or ignorantly misrepresented utterances of Henry George, and failed to come forward manfully and admit it when corrected." The assertion referred to is one I have made in several single tax papers, and probably a dozen other papers and magazines, including this one. It was this, that Henry George defended in the *Standard* the "corner" in wheat engineered by "Old Hutch" in Chicago a few years ago. That George claimed such men were public benefactors, and that such operations provided a legitimate use for capital. I spoke from recollection of the editorial in the *Standard*. At the next meeting of the club the president denounced the assertion as an unwarranted slander on Henry George, and stated that he recollected the editorial in question, and that the tenor of it was altogether different from what I had stated. You see, I was not "corrected." I was merely "contradicted." They could have easily settled the question by producing the editorial, but they knew better than to do so. Nor have they done so yet, though over two months

have intervened. Now, I make this offer: If Mr. Brokaw will reproduce the editorial in question in the columns of the *Courier* and it does not bear out substantially my assertion, I will pay for its insertion at the usual advertising rates, and will deposit the money in advance. Does Mr. Brokaw accept? I would also suggest to Bro. Brokaw the advisability of accepting with a certain reserve the playful extravagances of his correspondent, the Dugald Dalgetty of the club.

Mr. Brokaw says: "To one who has been so many years in the agitation as I have, meeting leaders of thought of all schools, it becomes exceedingly monotonous to read such stale objections, continually rehearsed, as Mr. Stuart advances." I fear this is mere vulgar boasting. Will Mr. Brokaw kindly give us the name of one "leader of thought" of the socialist school whom he has met in debate, either in print or on the platform? (I don't, of course, mean the depot platform.) For a man might meet "leaders of thought," such as Soup-bone Atkinson or Louis F. Post for years, and finally die of inanition from actual poverty of real economic ideas. Read Karl Marx, Mr. Brokaw, and you will likely learn more than you have from all the "leaders of thought" you probably ever met.

## THE TOOLS OF PRODUCTION.

BY GEORGE C. WARD.

In my last communication I endeavored to briefly indicate what would be the result of the elimination of the capitalistic exploiters and exploiting corporations from our system of productive industries and the operation of the same by the present wage-working employees, associated into co-operative companies and using their money savings and labor power as working capital. I tried to show that, if these co-operative associations continued to compete with each other in no greater or less degree than manufacturing concerns now compete and prices were kept up to their present level, thus preserving intact the fund accruing from interest upon cash capital and profit above fair wages, no one would be benefited except the workers thus associated into co-operative companies, who would get what now goes as interest and dividends, to banks and other money lenders and the partners in private firms and share holders in corporations. It will be noticed that I now assume that the single tax is in operation and that the money now paid as rent to landlords, as also the unearned increment which now goes into the pockets of landowners, is taken by the people, as a public revenue, for public use, and that all other forms of taxation have been abolished. It must be remembered, however, that this

will not affect price, as if rent is not an addition to price, it must certainly be an ingredient thereof and necessarily be included therein, so that the single tax paid upon land occupied for wealth or income producing purposes would be in the nature of an indirect tax upon consumers.

We will also assume that the principles of the single tax have a yet wider and more perfect application and enforcement, and that all public utilities, such as railroads, telegraphs, telephones, water, gas and electric light works, street railways, &c., &c., are owned by the nation, state, or municipality and operated by and for the people, at cost of the service, including a fair day's wages for an eight hour day, repairs, and interest upon and sinking fund for the payment of bonds issued for construction. This assumption not so much upon the strength of the following declaration:—

With respect to monopolies other than monopoly of land, we hold that when free competition becomes impossible, as in telegraphs, railroads, water and gas supplies, etc., such business becomes a proper social function which should be controlled and managed by and for the whole people concerned through their proper government, local, state, or national, as may be.

which single taxers will recognize as a part of their platform; but rather upon the more recent form of single tax faith which (socialist like) holds that a franchise is valuable only because the growth of society has made it so, and that, equally with land values, franchises belong to the people and their worth or value should accrue to the public benefit and not to the enrichment of individuals, or corporations. In this connection it may be stated that, rates, fares, etc., remaining as they are, the annual value of the franchise would, in most of our cities, more than pay all expenses of municipal government, and in some cities would pay such expenses two or three times over. This is an important fact as, in all such cases, the single tax upon land values would be available, in its entirety, for state and national revenue. Irrespective of the single tax, this is sound socialistic doctrine.

Now let us pause and inquire "where we are at." The land is nationalized in that each pays to all the value, or benefit derived or realized from the use or occupancy of land, so that all enjoy the ownership of land equally; while all receive from each the annual value of his or her use and holding of land, so that all use and enjoy the land in common. That settles the land question.

The railroads, telegraphs, telephones and express businesses are owned and operated by the people at cost of operation and interest and sinking fund upon and for cost of purchase and construction. That settles the question of transportation of individuals, goods, commodities and news.

The minor public utilities in cities, towns

and villages are owned and operated by the people, or community in the several cities and towns; either at cost, etc., in which case the people would be saved from the payment of interest and dividends upon bonds and stocks which now represent the value of the respective franchises; or else, the rates, fares, etc., remaining as they are, the money now paid as interest and dividends upon paper representing franchise values, would remain in the hands of the people as a public fund with which to pay the expenses of municipal government and provide useful and ornamental public conveniences.

This is all sound single tax doctrine, but it is also in line with the most radical and advanced programme of socialism. *En passant*, it may be remarked that it is also sound populist doctrine and strictly in accord with the programme of the people's party. The three chief issues in the populist contention are land, money and transportation. Numerous municipal, county and state platforms have attested to the fact that the programme, as I herein outline it, is that of the People's party, so far as transportation and public utilities are concerned. On the land question, the Omaha platform is a trifle uncertain and vague, but the rank and file of populist voters have long since stepped far in advance of their platform as relates to land. Most of them are what are known as "use and occupancy men." Single taxers have but to explain to them the correlation of the terms "common" and "equal" as applied to the term "in usufruct." They understand the term "common" and define "in usufruct" correctly as "use and occupancy," but many of them have yet to understand that land must all be of the same value in order that free use and occupancy may give all men the use of land "equally." So soon as a man thoroughly assimilates that idea, he is in a fair way to accept the single tax as an efficient and equitable means to the end of land nationalization.

But—a word to the corps of single tax writers. The first problem that confronts an intelligent farmer who has mastered Ricardo's theory of rent and comprehends the single tax propaganda, is something like this: Given a county in which the extremes of productiveness are twenty and sixty bushels of corn, and wherein the lands are about equally distributed between these extremes, the average economic rent would be twenty bushels of corn per acre—or one-half the average crop—Query: Is it intended to tax farm lands to that extent? This query has never been satisfactorily answered. With the present status of land statistics in the United States, it may be pointed out that with the throwing open to settlement of the hundreds of millions of

acres now held out of use by land monopolists, and the inevitable abandonment of the less productive sites for the occupancy of the more productive ones, the margin of cultivation would be greatly raised and the economic rent correspondingly reduced. This is all right, so far as is concerned the United States, but how about countries in which the pressure of population forces into use every available acre of land? In the next place it might be pointed out to the farmer that from this gross economic rent there would be deducted, annually, the current, prevalent rate of interest upon the value of all improvements and appurtenances, in order to find the net single tax the farmer must pay. Finally, the farmer might be asked to figure what proportion of his crop is now absorbed by the tariff and other forms and kinds of indirect taxes and his own direct taxes he now pays, all of which he would escape under a single tax régime. But this is a digression.

To resume. We have disposed of land and transportation and I will now add an issue to the three leading issues of the populist programme, making it read "Land, Money, Transportation and Tools of Production." I do this in deference to my own predilections in the matter and to point out a common basis of union for all who, like myself, are semi socialists, or socialists (limited), and who do not, as yet, admit the necessity of extending the socialistic programme so as to embrace the commercial distributive agencies, such as wholesale and retail stores, the mechanical trades and arts, or the professional and various phases of labor of service. In a word or two, the carpenters, doctors, painters, teachers, lawyers, barbers, store and office clerks, etc., etc.

Just here it may be well enough to introduce the programme of the new trades-unionism of Great Britain, now being discussed by the trades-unionists of the United States. It is as follows:

1. Compulsory education.
2. Direct legislation.
3. A legal eight hour day.
4. Sanitary inspection of workshops, mine and house.
5. Liability of employers for injury to health, body or life.
6. The abolition of contract system in all public work.
7. The abolition of the sweating system.
8. The municipal ownership of street cars and gas and electric light plants for public distribution of light, heat and power.
9. The nationalization of telegraphs, telephones, railroads and mines.
10. Collective ownership by the people of all means of production and distribution.
11. The principle of referendum in all legislation.

The phrase "all means of production and distribution" would seem to include mineral and timber lands, stores and railroads, although railroads and mines are covered by section 9. There is no doubt, however,

but that manufacturing plants, including machinery and tools of production are included in the phrase. Assuming that "means of production" must have been intended to include "land," and that the single tax is the best method of establishing an equal, yet common, ownership of the land, it will be seen that on land and transportation, public utilities, etc., single taxers and the new trades unionists are in harmony and unison.

The ethical basis for the demand for public, or common ownership of "the tools of production" (improved, labor saving machinery) has already been indicated. Briefly stated, it is the common heirship in all triumphs of the inventive genius of man, on the part of every member of the human race—organic man. Again, it may be stated as the indefeasible, common ownership, on the part of every individual of the human race, of every benefit conferred upon the *genus homo* by and through the inventive genius of human beings who lived and toiled in past generations. It is equally as easy to prove that individuals have a right to monopolize and hold out of use the land as to prove that individuals have a right to monopolize to their own selfish use and benefit the results of the past triumphs and achievements of the entire human race. This is a fundamental and basic ethical proposition, the disregard of which has differentiated the human race into a few thousand millionaires and hundreds of millions of paupers. I may not have expressed this idea in as glowing terms, or well rounded periods as it might be stated, but I have stated it plainly and by it I stand or fall.

The economic basis for this demand is the apparent evils resultant from individual ownership and control and the easily apprehended benefits that would result from communal or public ownership. Not only has the value of all displaced labor flowed into the coffers of those who own the labor displacing machinery, but much of the labor employed and utilized is that of women who should be at home attending to their household and parental duties, and children who should be at school laying the foundation for a life of honorable and useful American citizenship. The adult males, who should rightfully perform the work of the nation, are tramping the continent as vagrants and tramps, while their honest, earnest and despairing competition for employment only serves to more fully pauperize the toiling masses, and their tears and groans and sufferings are transmuted into gold in the coffers of the usurping pirates who have stolen the goodly heritage of the human race. The private ownership, by the few, of the sources and tools of production, has and ever will result in misery, war

and industrial serfdom. Their public ownership will usher in an era of joy, plenty, and industrial emancipation.

Now please, Mr. Single Taxer, do not spring upon me that stale old chestnut about "access to natural opportunities etc., etc." A natural opportunity to a man without capital to develop it, would be about as useful as an elephant to a man who had no circus and no money with which to buy hay. The farmers of the nation are sick unto death of a disease which orthodox "regular" doctors tell us is "overproduction," but we, heterodox, "quacks" though we may be, know that the patient is suffering from underconsumption, caused by the inability of the toilers in the cities to purchase and consume farm products. If you set all the unemployed to producing food, you can hardly expect those now at work to eat it all, when they cannot eat what the present number of farmers can produce. The cure is a reduction in length of the day of labor, and the substitution of men for women and children, so that all men who will work, may work; and an increase in the wages paid for a day's work. The establishment, ownership and operation, by the people's government, of the manufacturing and mining plants of the nation and the diversion into the "wage fund" of the hundreds of millions which are now paid as interest and dividends, would not only allow the reforms I have indicated to be inaugurated, but would also admit of a very decided reduction in the price of coal, iron and manufactured products.

I shall not attempt to indicate the manner in which this innovation might be brought about. There are several feasible plans and the undertaking, as a whole, would not involve half so large a financial transaction as would the assumption by the government of the ownership of the nation's railroads. But one thing I wish to state and that is that it would not involve or necessitate any change in monetary systems, or a transition from money to "labor checks," any more than does our present public operation of the postal system, or our prospective public ownership and operation of our railroad system.

But, for the benefit of my friends Gros and Borland, I want to outline a scientific system of gradation of wages. The statement, often made, that one day's labor is worth another, and that a day's labor would be an equitable and scientific unit or standard of value, is subject to the following limitations. First: provided the same cost, in time and money, is expended in preparation for the kind of occupation the laborer is employed in. Second: provided the expenditure or loss of vital energy, or life force is the same. These two quali-

fications are, to a great extent, compensatory, or self-balancing, because as a rule, the laborers in occupations for which the most costly preparation is necessary are likely to live much longer than the laborers who do not require such costly preparation. The scientific rule is this: "Each worker should be able to earn the same wages in a lifetime spent in labor." Hence a man engaged in an occupation in which the laborers enjoy an average duration of life of twenty years should receive double the wages paid a laborer engaged in an occupation wherein the laborers' lives average forty years. This is scientific, yet simple justice applied to wages. All that is needed is to grade the wage scale as life insurance premiums are graded, and by the same actuary's mortality table. This can be done in dollars and cents and as well under a socialistic as under a competitive system, the people's government being the wage payer.

These ideas are submitted with the reservation that nothing contained therein shall be construed as committing me to the single tax programme. I am simply studying along those lines. In New Zealand, very excellent and surprising results have been accomplished by the abolition of all taxes upon personal property and improvements upon land and the substitution therefor of a tax upon bare land and a graded income tax. There is first a general *ad valorem* tax upon bare land, assessed at its actual cash value; next, a graded tax upon all lands above a certain value, owned by any one individual, firm or corporation; lastly, an additional tax upon lands held by alien owners. If the assessed valuation returned by land owners does not come up to the governmental assessor's estimate of the land's true value, thirty days notice is given and if the land owner fails to amend his return, the government pays him the valuation he himself affixes upon it, with ten per cent additional and the land reverts to the government. Holders of land mortgages are taxed as part owners of the land. A graded income tax is levied upon all incomes derived from any and all sources except land, all incomes of less than fifteen hundred dollars being exempt.

## INTEREST AND THE CAUSE OF INTEREST.

BY A. J. GRAY.

The wealth of this country, and, in fact, the wealth of the world, is rapidly becoming concentrated in the hands of the few who live without work, and the masses, those who do labor and produce all wealth, find it growing more difficult to get a living. If the rate of wages is higher than it was forty years ago, employment is more uncertain, and a chance to toil and earn bread

by the sweat of the brow, is becoming a privilege, a boon which the honest, faithful toiler must beg of the few who have it to bestow.

Labor organizations have served to keep up wages but not to increase opportunities for employment, and, unless there is a change, it is only a question of time when they will be forced, by the vast army of unemployed, to accept reduction after reduction until a wage is reached which will give but a bare living. What the laborer should aim to do, and what he must do if he would permanently better his condition, is to bring about a change which will increase his opportunities for employment and give him a larger share of that which his labor produces. Labor organizations should be schools in which laborers should be educated in the laws which govern the production and distribution of wealth; then when they have learned what will better their condition, they have the power through the ballot, to give expression to their views in the form of law.

No one denies that enough could be produced to give to all an abundance were laborers given free access to natural opportunities. But they are denied free access to these opportunities to the materials of production, and are only given access to such materials when they consent to surrender a large part of the products of their labor to a landlord or a capitalist. Had they free access to these opportunities, and were they permitted to retain the full product of their labor, the wealth of the world would soon be in the hands of the laborers, and the distribution would be fair and equitable.

Products of labor are now divided between the laborer, the landlord and the capitalist. Labor does all the work and gets little more than a bare living, while landlords and capitalists do no part of the work but manage to become multi-millionaires on the share which goes to them. It is through exactions for rent and interest that the few, who perform no labor, grow wealthy, and the many, who labor and produce all wealth, are impoverished.

Neither rent nor interest are just, and both can and must be turned to the advantage of the laborer if he would retain the full product of his labor. There is an irrepressible conflict between the laborer on the one hand, and the landlord and capitalist on the other.

Labor is the only active factor of production without labor there could be no production. Land produces no wealth, it furnishes the material which labor converts into wealth or capital; and capital furnishes labor with that which makes it more efficient; of itself capital produces nothing.

While land without labor will produce

no wealth yet it will, by reason of an ever increasing demand for land, caused by increase of population and advance of material progress, increase in value. That is to say, it will not produce wealth nor will it add to wealth, yet it will give to its owner the power to command a constantly increasing share of that which labor produces upon, or with land. Rent will increase even though land be unused by labor.

Capital, without labor, will produce no wealth, neither will it add to wealth. Unlike land, it will not increase in value with increase of population and advance of material progress. On the contrary, capital will not only not increase in value by the mere lapse of time, but, without the expenditure of labor to care for, preserve and protect it, capital will constantly decrease in value. This decrease results from disintegration and decay, change of customs and fashions and improvement in machinery and processes of production. Nature is constantly changing the form and place of matter, tearing down and rebuilding: there is no form of wealth which is an exception to this rule, and constant care is required to counteract this tendency of nature to decompose and recombine with all her material.

Wealth accumulated for future use not only does not increase but it is a burden, a charge upon the owner if he would keep it intact. Without labor capital does not increase in value, it earns no interest, it is a charge upon the owner to the extent of labor required to care for it, or for storage, or insurance to guard against loss, if it does not actually depreciate in value from some of the causes mentioned. Investments in land are made for two reasons: one, because it is a safe means of preserving wealth which has been accumulated, not for present but for future use, and the other, because it will increase in value, and when wanted for use, more wealth can be obtained in exchange for it than was required in exchange to obtain it. This increase in value is called "unearned increment."

There is, as we have seen, no unearned increment arising from an investment in wealth, but, rather, an unrequited decrement.

Then why should one who has accumulated wealth which he does not wish to now use, and, in fact, has no present use for, require of another, who has immediate use for it, and who, borrowing it, undertakes to return it when the lender wishes to use it, not only the return of the exact amount borrowed but a large sum in addition? Does not the borrower render a valuable service to the lender when he relieves him of the trouble and expense of caring for his wealth until such time as he wishes to

use it? On what principle of equity can he require the return of more than the amount borrowed; does not the service of the borrower, in caring for and preserving the wealth of the lender, place him under obligations to the borrower? The temporary advance of wealth may be an advantage to the borrower, but that is no reason why the lender should be rewarded with an increase.

If we do not go outside of the transaction itself, the obligation incurred, upon a loan, is as often, if not more often, from lender to borrower than it is from borrower to lender. Then why do men consent to pay interest for the use of wealth or capital?

Interest is paid not because capital earns it, nor because capital, as such, could command it, but because capital and land are interchangeable, and land will increase in value without cost or care on the part of the owner.

Interest is caused by the monopolization of land which enables individuals to appropriate rent and the unearned increment of its value.

Interest does not regulate rent, but rent and the increase in land values regulates interest. I use the term interest in its economic sense, which differs from commercial interest in that it excludes insurance against risk.

Rent cannot be abolished, neither can it be decreased as long as individuals are allowed to appropriate it. Take the rental of land for public use and no profit could be made on an investment in land, and no gain could be had by the control of land except it was used productively, and then the whole gain would go to labor. There would then be no form into which wealth could be changed in which it would increase in value without labor, and would not be a constant charge upon its owner.

Cheaper money to such an extent that values would double, and the rate of interest would remain the same; the amount of money required to purchase a tract of land would be doubled, rent would be doubled, and the amount of interest paid on money obtained to make a given investment would be doubled. If the current rate of interest was six per cent., and government should loan money at three per cent., it would result in doubling the price of land, and rents would then be but three per cent. on the value of land, but the amount of rent would be unchanged.

Capital may be said to be omnipresent, it is easily transferred from place to place; this is not true of land, it cannot be moved from one place to another to equalize supply and demand, and equalize rent. Rent is an absolute quantity, it is not determined by the rate of interest, nor the amount of

capital invested. It varies greatly in different localities in which the rate of interest is the same, but it appears not to vary, because the rate of interest determines capitalized rent or present selling price of land. And, as all capital is potentially everywhere—at all times, it operates to equalize the return from the rent of land by making the present value of the land conform to the amount of capital which would return in interest, a sum equal to the rent of the land.

Interest is caused by rent, but the rate of interest is not determined by rent at any one place, nor can it, when risk is eliminated, be more than temporarily higher in one place than it is in another. Whether it is the average rent and unearned increment, or some other rent and unearned increment which determines the rate of interest, I cannot say, I only go so far as to affirm that it is rent and the unearned increment of land values, which causes interest. By using the rate of interest as a divisor, and the annual net rent of a given piece of land as a dividend, the quotient will be the market value of the land. To illustrate: suppose a lot in a growing town is purchased for \$100, and is rented for a period of five years at eight dollars a year, the lessee to pay all taxes and expenses. The current rate of commercial interest being eight per cent. this is considered a fair rental. At the expiration of the five years, with no further outlay on the part of the owner, the growth of the town has caused a greater demand for lots, and there are those who will now give the owner of the lot sixteen dollars a year for its use. If the rate of interest has not changed, the lot is now worth \$200. Should the rate of interest be reduced to six per cent., the lot would be worth \$266.66, and should this reduction in the rate of interest result from greater stability of values, and greater security, thus eliminating risk and lessening insurance, the same cause would increase the value of the lot, and this same local cause would have lowered commercial interest and increased rent. Here, obviously, interest had nothing whatever to do with determining rent; if it had, the rent of the land and its selling value, would have remained unchanged if the rate of interest did not change, and should the rate of interest change, as suggested, to six per cent., the \$100 invested in the lot should return but six dollars, and the rent of the lot should be six instead of sixteen dollars, at the end of the five years. Examples, like the one given, are of common occurrence, and they conclusively show that rent is not determined by interest. The rate of interest serves only to determine the capitalized rental or market value of land.

Take the economic rent of land for pub-

lic use, by the single tax, and away goes interest and speculative rent. Then the laborer will get the full product of his toil, for he would then have access to land by the payment of a small rental equal only to the superior advantage of the land used, and would pay no other tax, or charge; and capital would be at his command with no charge other than the return of the amount borrowed when wanted to be used by lender.

### TAX REFORM.

BY S. D. GUNN.

The Washington *Post*, a paper of recent birth, liberal, non-partisan and ably edited, thinks well of the single tax, mentions many good results that it believes would follow from its adoption, and I think would fully endorse it, only, as it says: "It has not been made clear to it how it could bring the millenium;—change the nature of man;—inspire with industry those who are now idle and vicious;—increase the number of the thrifty and lessen the number of the incompetent and worthless." These things the *Post* "finds it difficult, if not impossible, to believe." There are some who can be made to see the truth or the natural and inevitable effects of a cause, only by ocular demonstration. These are those who have not the intellectual ability to reason from cause to effect. Does the *Post* wish to be classed with these? It seems to the *Post* that, so long as there is land to be had at a merely nominal cost by all those who really wish to earn a living through honest toil, there is little reason to revolutionize our system of taxation in pursuit of an ideal.

Judging by the ability displayed by the editor of the *Post* he must be possessed of a very high order of intellect, that his reasoning powers must have been developed to a high degree and that he must be so thoroughly well equipped that he can argue from cause to effect, and will, as every unbiased mind must, reach logical, unrefutable conclusions. He who is thus equipped needs not that others shall make clear to him the results which must inevitably follow the adoption of the single tax. It is not clear to the *Post* "how Mr. George's remedy will usher in the millenium." What is the millenium? It is our highest ideal of a state of perfect happiness, and must come through the aggregation of all those things which we believe or imagine will when operating together at the same time produce the maximum of happiness. The *Post* mentions almost numberless things which it says the adoption of the single tax would do, which are just the things that must be done to create or bring about the millenium. It is not even imagined by its warmest advocates that the single tax could

usher in the millenium in all its fullness, it must come and can only come through the slow process of evolution, but they do believe, and the *Post* itself must believe, because it affirms, that the single tax will usher in those things which will create the conditions precedent to the ultimate realization of the millenium. The *Post* affirms "that the single tax would simplify taxation." Assuredly it would, the simplification of taxation would be a good thing, as the language of the *Post* plainly indicates that it believes. It would help to bring about better conditions, conditions precedent to the realization of the millenium. It believes that it "would remove a great many difficulties and inequalities." These difficulties and inequalities are obstructions, the removal of which would open the way and free the course, so that those things which produce the conditions precedent to the realization of the millenium could have free operation, which would greatly hasten its realization. The *Post* sees, as it unequivocally affirms, "that it would make drones among land holders contribute their proper share toward the common fund, and put the penalty, if penalty there must be, upon sloth rather than upon activity." In doing this, and the *Post* believes that it will, verily, it will be helping to form the constitution of the millenium and accelerate its coming. It also sees that "it would create countless opportunities that do not now exist. To be a millenium countless opportunities must necessarily exist. The *Post* cannot conceive of a millenium without them." But "it is difficult if not impossible" for the *Post* "to believe that it would change the nature of man, that it would inspire with industry those who are now idle and vicious, that it would increase the number of the thrifty and lessen the number of the incompetent and worthless."

Now, in asserting that it cannot believe that the single tax will do these things the *Post* virtually admits its inability to reason from cause to effect. All who know anything about the working of our present system, even the millionaire and monopolist will admit, for indeed they must know, that the reason why there are so many people who are ever in straitened circumstances, so many who are continually struggling with all their might to keep food in the larder, decent, respectable clothes on their backs and a shelter over their heads, so many who are so abjectly poor that they cannot live decently and make both ends meet, and so many paupers and tramps is because of lack of opportunity. As natural opportunities begin to grow scarce, owing to their having been appropriated by the rich, the above conditions begin to develop, and as such opportunities become more and more scarce, these conditions manifest

themselves with greater virulence. The *Post* knows that all natural opportunities which can be made available at the present time have been gobbled up by the rich and in most cases are held on speculation until the demand for their use becomes so great that the holders are able to realize fortunes by their sale, and it knows, too, that these fortunes were not earned by the holders, but that they were created solely by the community, that it was the presence of all the people with their intelligence, energy and labor which gave the value to every opportunity. Natural law commands that exact justice be done. Natural law proclaims that justice consists in insuring to each all that his intelligence, energy and labor may create, and preventing any one from obtaining any part of that which others have created without their free consent. The *Post* knows that the placing of laws upon the statute books to subvert natural law and set aside justice must, in the end, prove disastrous. Natural law cannot be subverted, neither can justice be set aside nor ignored with impunity. The history of all times and of all nations conclusively proves this. Natural law declares that all men are born equal, and endowed with certain inalienable rights, among which are life, liberty and the pursuit of happiness. Each having these inalienable rights, then each has an equal right to maintain them. These rights can only be maintained by the same processes and the use of the same means, then each has an equal right to avail themselves of the same processes and to make use of the same means. Natural law declares that these natural and inalienable rights can be maintained and made secure only by each having at all times and under all circumstances an equal right to the use of the land. Natural law not only declares and proclaims this, but commands it; disobedience, and misery, poverty and degradation will surely follow; obey, and there will as surely follow plenty and happiness. Says the *Post*: "It is difficult if not impossible to believe that Mr. George's remedy would change the nature of man." We can judge what we suppose to be the nature of man only by his acts. A hog will, when hungry, crowd another out of or away from the trough, and we say it is the nature of the hog, but when it has eaten its fill it will go away and lie down, and neither by force nor persuasion can it be gotten back again. Judging by its acts, it has evinced two contrary natures. A watchdog springs with vengeance at a stranger who attempts to intrude on his domain, and again we say it is the nature of the dog, but immediately his master calls him and proceeds to fondle him, his fierce vengeance is gone and he manifests the utmost pleasure and delight. Under different circum-

stances they each evinced opposite natures. A man brought up in an orderly community, by an industrious father, who has taught him from his earliest years that industry and temperance are prime virtues, that honesty and kindness will insure the respect and esteem of his fellow men, that righteousness consists in doing unto others as he would have others do unto him, and that only by the practice of these things can he hope to succeed in life in all that makes life essentially successful. With such environment and such teaching he will become so thoroughly imbued with their spirit that the practicing of them will become so natural to him that thereupon will depend his happiness. We ascribe these virtues to him and declare that their manifestation must be in accordance with, and prompted by his nature. Now, all men are possessed of the same nature. All men are human beings, and, therefore, must be possessed of the same nature, *i. e.* human nature. But human nature is susceptible to influences, and as the influences are good or evil there will be developed a good or an evil disposition. With such influences and training as received by the man mentioned above a saintly disposition would be developed. With influences and training of an opposite character there would be developed a devilish disposition. This is manifestly self-evident, it is the effect of the law of nature, of natural law, and, therefore, inevitable. A man born and brought up in the slums, associating continually with the inhabitants of the sub-cellular of society, with the idle and vicious, with harlots, thieves and murderers, there will be developed in him, he being a human being, a devilish disposition.

The *Post* plainly sees and admits that the adoption of the single tax "would make drones among land holders contribute their proper share toward the common fund, and put the penalty, if penalty there must be, upon sloth rather than upon activity." It must also see and admit that the drones having been made to contribute their proper share, that the poor would surely be relieved of an unjust, grievous burden, and sloth having been made to pay the penalty—if penalty it chooses to call it—and in that degree relieved activity; the slothful would be impelled to activity in order to meet the penalty, while the active would rejoice and be inspired to put forth greater activity. It also sees and admits that its adoption "would create countless opportunities that do not now exist." It must also see and admit that these countless opportunities would soon be taken advantage of by countless numbers of people. If its vision is not perfectly clear as to this, and cannot admit it with entire readiness, it has only to contemplate the opening to

settlers of Oklahoma and the Cherokee Strip.

The *Post*, in admitting that the adoption of the single tax will do these things virtually admits all that its advocates claim for it. These things are, indeed, the very foundation of the physical and material constitution of the millenium, and in admitting that the single tax will bring about conditions that will ultimately change what the *Post* is pleased to call the nature of man, virtually admits that its adoption will bring such benign conditions as will surely produce the morals and ethics which must form part of the constitution of the millenium.

### LABOR'S NEW PHASE.

BY MARIE LOUISE.

Abraham Lincoln was more than a humanitarian, more than a wise statesman and energetic chief, he was a philosopher and a prophet. After the war of secession the fumes of victory and of complete success in his undertaking did not obscure his judgment or blind his mental perception. The good accomplished by the war he estimated at its true value, and the evil which the emancipation of the negro slaves and the centralization and consolidation of political authority might bring forth, did not escape his penetration. His glance pierced the mist of times to come and his prophetic eye could see events shaping in the bosom of futurity. We may imagine the pang of sadness at his heart when he said:

I affirm it as my conviction that class laws, placing capital above labor, are more dangerous to the republic at this hour than chattel slavery in the days of its haughtiest supremacy. Labor is prior to, and above capital and deserves a much higher consideration.

Since these prophetic words were uttered hardly thirty years have gone by, and already the social chaos which Lincoln foresaw is upon us. Capital towers above labor, the base is uppermost and the structure swings, for the line of gravity falls over the circumference of the base. In the inverted social edifice labor is on its knees, alternately praying, asking, demanding to be heard.

Anteriorly to the Ann Arbor strike in March, 1893, the working people were led to believe that trades unions could, by a strong concentration of their forces, effectually cope with the rapacious out-reaching of organized capitalism. The question of capital vs. labor was thought to be an issue collateral, if I may use that expression; the battle was in no way connected with, nor detrimental to the political rights and political equality of the combatants. These, it was believed, resembled two brothers descending to a corner of the back yard to adjust with their fists, and unknown to their parents, a quarrel between them.

The laborers assumed that they were fighting a free battle, on a free ground, with equal chances for both parties engaged. This faith of the working class in political equality accounts for the rapid spread of trades unions in this republic. Those sectional organizations, like the guilds of the middle ages of which they are a modified reproduction, were pregnant with a disastrous principle, viz.: Sectional strife and warfare among the various parts of the general body.

Great as this injury proved to be to the organized workingmen, it was borne patiently or it was overlooked for the sake of the great power the organization was supposed to possess for checking the encroachment of the capitalists. But the Ann Arbor strike of last year, which provoked the injunction of Judge A. T. Ricks, and afterwards that of Judge Taft, sapped the foundation of trades unionism in this country. The action of the court of justice in interfering in the strike in the interest of the corporation and by the verdict given against Chief Arthur, as representative of the brotherhood, together with the proceedings entered against several strikers, have virtually declared trades unionism an illegal combination of men amenable to the penalty of the law. All illusions about the efficacy of trade and craft organizations to cope with capitalism have radically vanished; the legislature has openly declared itself in favor of capitalists and this decision settles the question definitely. "The strike," says Mr. H. W. Ashley, general manager of the road, "attracted general attention for two reasons. First, Because it was the first time the judicial authorities held that employees of a common carrier were semi-public servants and must perform their duties so long as they remained in the service of a carrier. Second, Because the chiefs or leaders of a labor organization, irresponsible, unincorporated and unknown to law, were held criminally and financially for the overt acts of the orders they represented."

Arguing the case, Judge Ricks incidentally mentioned that "in 1891 he had granted a similar mandatory order on a bill for an injunction filed in that court by the Wheeling & Lake Erie railroad, which was enforced with beneficial results as against its engineers, firemen and trainmen who had refused to handle inter-state commerce freight loaded on cars consigned to various ports on Lake Superior and Lake Michigan."

Manifestly, the standing in court of employers and employees is not on a base of equality, neither is it on one of equity. It is amazing to see the length of time it took the American workingman to discover that. The equality before the law is a

word to which no substance is annexed, yet the ringing of the word has been sufficient to dazzle the toilers and rock them into slumber. He who fancies himself free and complacently sits down to compliment himself on his splendid condition, is not far from having the manacles of despotism clasped around his limbs. "Eternal vigilance is the price of liberty," let us not forget it. No man, nor law, nor established condition may be safely entrusted with the keeping of individual liberty. Men are variable, laws are plastic, conditions are uncertain. Why? The assumption of the law used by Judge Ricks that "*an act done by an individual in the exercise of a right may be lawful, but when done by a number conspiring to injure or improperly influence another, may be unlawful,*" is an emphatic condemnation of the working people to silence, submission and servile degradation. Between an employer and his employes the contest is always that of a single individual or corporation with several individuals. The employer being "single," according to the law, may legally exercise his right, but the employes being a "number" are forbidden to exercise the same right. Actions done by several individuals are, of necessity, concerted actions and may easily be construed into an attempt at conspiracy. A law can always be found to fit a case, especially when that case is tabooed. After the Scotch rebellion of 1745, the English judges said to the government: "Bring on the men you want executed, and we will find the laws to hang them by."

Obviously, the attitude of the court in the Ann Arbor difficulty has sealed the destruction of past trades unionism and shown the necessity of organizing all the toilers, regardless of grade or conditions, into a solid, compact body of trade societies, not federated but confederated, in order to present to capitalism a front which neither it nor the legislature, on which it leans, will dare treat with contempt. The toilers must stand shoulder to shoulder for the elevation and dignity of labor; they must close on one another and form a wall impenetrable to capitalistic bullets. The breach in labor's camp has always been the cause of its defeat; nothing else under the sun could ever have conquered it. Hitherto it has been too sectional, too sectarian, too exclusive; each trade or brotherhood has acted with a view to serve its own interests regardless of the injury it inflicted on the other fellow workers. It has ignored the fact that the "concern of one is the concern of all;" that class distinction, class rule are death to the welfare of labor and the consequence of this error is the present situation, where, as Mr. Depew, an eminent authority on such matters, lately said, "*to-day fifty men can meet together and stop every wheel and every wire and paralyze the entire*

*country within the space of twenty-four hours.*"

Fellow workmen, read this statement of one of our millionaires over and over again, until you comprehend the full extent of its meaning. Repeat it to yourselves until you utter it in your dreams at night, until your dreams are transformed into a nightmare and the horror of your position haunts every one of your steps. Slumber not; awaken! Fifty men have it in their power to throw you and your dear ones face to face with starvation and the terrors that fatal word implies, within the space of *twenty-four hours*. The power of capitalism has reached its summit, and nothing but a confederation of all labor organizations and the organizing of all workers can counterbalance that immense power of money. Not only does enforced idleness and starvation confront us all, not only are millions of toilers out of employment, and compelled to receive charity and beg, but it has become evident that the stricken laborer must bear his misery in silence and say "God bless you" to the rich who gives him alms out of the wealth which, as Adam Smith solemnly declared, *is produced by labor and by labor alone*. A worker unemployed does not remain long in that position before his clothes wear into tatters and the last of his shirts drop into shreds. Let him travel on foot several miles to look after work, let the dust of the road cover his poor clothing and besmear his hair and face, with no money in his pocket to get a room to wash himself and brush off the dust on his garments, and you will have an individual which the wealthy class and the monkeying class of clerks will call a dirty, "soap-fearing, vermin-haunted vagabond," as his "Highness," Dean Francis Wayland of Yale college described the unemployed of Boston on their way to Washington, whom the Yale students intended to receive and befriend in New Haven, yesterday, April 30.

The insults, irony, lies, malignity which the mercenary press of New York, the corrupted politicians and the besotted money class heap on the unemployed who dare to mention their suffering, throw in the shade all the brutal virulence the bloated feudal lords of the middle ages poured on their rebelling bondmen. It needed an industrial crisis like that we now endure and the enforced idleness of several millions of toilers to discover that so much turpitude lay potential in these puppets of authority and moneyed aristocracy. Instead of putting on sackcloth on beholding so much misery, dirt and degradation in the very bosom of the great American republic, they laugh at and scorn and malign the victims of the capitalistic, monopolistic system which has obtained and consolidated.

The New York Sun has a staff corres-

pondent whose purse is too empty to be an independent capitalist, and whose mind is too foul to sympathize with or assist the dependent workers. That "Jesuit in short gown" manages to procure statistics which prove "that the distress and the destitution caused by the present crisis among the earners of wages have been enormously exaggerated by the well-meaning but inconsiderate philanthropists who have undertaken to relieve them. \* \* \* \* The collections made for the relief of the unemployed poor here in this city (New York) so far as the amount has been published, has not exceeded \$250,000, which would not suffice to furnish with food, fuel and clothing for more than a single week the 200,000 persons said to be on the verge of starvation." In a subsequent contribution he writes: "As I pointed out last Monday, most of the writers and speakers who declaim against the existing order of society and urge the adoption of the improvements upon it which they have devised, are ill-informed as to the facts of the case, and accept for the truth the fancies of their own excited imagination. Throughout all this past hard winter, scarcely one solitary case of death from actual want of food has been brought to light, etc."

The *Sun* paper may have been num regarding the daily occurrence of death through want of food and the numerous suicides caused by hunger, which happened in New York these last eight months. That organ is perverted enough to suppress this news for fear of disturbing the rich in their palaces and their feasts; but other papers, though pledged against the unsubmissive, starving laborers, have published accounts whose horror sufficiently demonstrates the enormous dimension of the suffering among the masses.

By a strange coincidence an appeal to the rich in favor of charity made by Secretary Herbert, of the navy department, has aroused the ire of the editor of the *Sun*, and he gives vent to his hatred of the discontented unemployed in his usual incisive style. Among other things he makes statements which give the lie to those of the "Jesuit in short gown," who contributed the lines I have quoted above. In the heat of his indignation the editor exclaims: "Probably never before in the history of the world were the contributions of the rich for the assistance of the poor so great in volume during a corresponding period as they were in this country during the prevalent dulness of last winter. In this city (New York) alone they amounted to millions of dollars, and throughout the union, in almost every community, they were as large porportionately to the suffering. The aggregate of this charity was enormous, and it was expended by the rich at a time

when they themselves were enduring losses of both capital and income produced by the same causes which deprived labor of employment. The system of private charities was extended and enlarged to an unprecedented degree, and the sum contributed for the alleviation of the distress and importunity was vastly increased by the gifts of individuals who wanted the satisfaction of being their own almoners. \* \* \* Moreover, that vast volume of benevolence did not serve to relieve or even to mitigate the social discontent of which Coxey is a representative. Rather, it has aggravated it."

This is the way labor is assailed to day by the illogical, inconsistent, unintelligent press of the country because a new spirit has arisen among the toilers; a new impulse for self-preservation is moving them; because they combine and confederate into one body, moved by one idea, and they step forward with one uniform step, with faces turned toward the goal their present misery has revealed to them.

### KEEP SWEET.

BY JOSÉ GROS.

The conditions of modern societies are no doubt extremely complicated. The worst feature we have to deal with is the very multiplicity of reform movements that are being agitated. We have really *un embarras de richesses*, as the French say, an embarrassing wealth of reforms. That is very provoking, but it does not need to be discouraging. Chaos must precede order, and chaos is here, among us, in the midst of all nations, in our own perhaps more than anywhere else. But why should we need chaos after so many centuries of order? We only see an answer to that question, viz: The order we have had has rested on oppression, not on freedom, on injustice, not on ethics. And all because hate has been constantly prevailing among men.

Look at the history of all religious developments. It has been a history of hates. Yet, where shall we turn, for reform in that direction, if not to religion of some kind? And no kind of religion is good for much that does not teach men how to suppress hate, and hence how to keep sweet. And very few men seem to have learned anything of the kind as yet. The point is illustrated by many social reformers to-day. Here we are, trying to discuss the methods by which modern civilization can be saved, and every now and then we, some of us anyhow, feel inclined to make an exhibition of ourselves through absence of sweetness towards each other. That will never do. We can only reform humanity by reforming ourselves. We can only reform ourselves by keeping sweet with each other, while suggesting our respective methods

through which humanity can most effectively realize divine ideals. Let us be aware of imitating the great multitude of religious cliques that for centuries long and many have quarrelled among themselves, and have thus made such a dreadful hash of what we call Christian civilization.

To begin with, we reformers should not care about converting each other to our own hobby. Perhaps it is better that we should not. Our principal mission is to make men think by themselves, and to think noble thoughts. That involves, on our part, great duties and responsibilities. We must teach men how to trace effects to causes, how to discriminate between truth and error, and even between truth absolute and truth relative. That can only be done by carrying our discussions on a very high plane, and hence avoiding all personalities, all harsh epithets, all bitterness, etc. We should not write for the sake of vain-glory in trying to show that each one of us is better than the rest of us, or some one here and there. We should aim at the upheaval of humanity regardless of fame to any of us at the expense of anybody else.

Two articles in the June MAGAZINE come to most vividly reflect the meaning of our above thoughts, with the coincidence that they both are from the pens of two socialists. One of the articles is couched with a beautiful elevation of views which is very refreshing. The other article is rather depressing and sad. In the former you can follow thought after thought, gliding along as the notes of a gorgeous melody, in gentle undulations, to express the holy aspirations of its composer. You may not quite agree with all his thoughts, but never mind about that. All the same you may revel in the balmy altitude to which the writer has carried your soul. You can, for a few moments, forget all your own special ideas about such and such processes, as the most direct to arrive at certain results. You can even say to yourself: Well, if the conceptions of our own reform group were found wanting, after they had been tried, we should not object to follow the lines suggested by that other reform school, as presented to us by such a writer.

We shall now try to be frank with that other friend of ours, that other socialist who, in his June article, gives us an extra dose of sarcasm and personalities. We don't really see the need of any bitterness among reformers because they happen to disagree. Even disagreements are useful among men if they only keep sweet. Disagreements act then as stimulants on the fibres of the soul. They embody that grand law of free competition, indispensable to all healthy, physical and mental development, working among men as it works among the stars, re-

vealing the existence of a Power who is in favor of freedom and against oppression even in forms relatively mild and gentle.

We can hardly conceive of a more gentle oppression than that exercised in many of the least objectionable religious orders of times gone by, symbols of socialistic organizations, where the general good of each set of people in each convent was the primary and final law, as it would be in the socialistic régime, yet, they all proved a failure, and the broom of time swept them off as mere cobwebs, as hinderances to human progress.

Absence of free competition evolves petrification in thoughts as well as in acts. Life is motion, atomic, molecular or molar, in chemical or vital forms, and hence invisible to mortal eyes, or in grand, mechanical, invisible display of power, in the cosmos as well as in the realm of social growth. In the latter history tells us that free competition is life, and their absence is death. If civilizations have perished, if human institutions have decayed, if Christianity itself, the Christianity of men, has failed to give us peace on earth, it is all because the *law of free competition* has found tyrants everywhere, in all times and under all flags, in all churches and all states or nations.

That absence of free competition, the inevitable concomitant of land monopoly, growing in intensity as land monopoly grows; that alone accounts for all social deformities, when we stop to think sober thoughts, and disdain to waste brain force in sarcasms against those who have something to say different from what we say. Such sarcasm constitutes a virtual surrender to the logic and sense of our opponents. We then literally give up our own case. Sarcasm tends to deteriorate our own perceptions of right. It implies a spirit of intolerance, and a reformer should be tolerant if he is anything. He should strive for high ideals in conduct. In the battles of thought the victory invariably comes to the gentle writer, never to the sarcastic one. We don't need to object to some occasional funny sally in connection with this or that self-evident conclusion. All else, in the discussion of serious subjects, is mere wasting powder in fire salutes, celebrating the triumph of those who oppose our views with solid facts and gentle language. The latter alone enables us to discriminate and reason correctly in all social phenomena.

For instance: Take the most prominent evils of the day such as the professional tramp, the tenement house, lots of faithful workers out of work, the drunkard, the insane asylum, the absolute poverty of the poor and the relative one of many of the rich, disease among all classes from pauper to potentate, religious indifferentism on

one side and religious fanaticism on the other, abandoned farms in sight of towns, and abandoned city lots in the bosom of large cities. Do you want to know the why of all such barbarisms and many others in the midst of the highest forms of social growth? Keep sweet and ask history about it. The answer will come to you in four words—"absence of free competition."

The writer lives in a street 70 feet wide by 700 long, 5 minutes walk from smiling fields in one direction, and 15 minutes walk from the business center in a town with 10,000 population. Out of the 14 residences in that street, we have one, two or three that remain abandoned for long periods, not always the same of course. Does that mean a depreciation of land values there, or the poverty of those who remain there, or any drawbacks in that locality? It would be difficult for you to discover a more convenient or charming place. To be sure, a lot 100 by 200 represents about \$15,000. Absence of free competition makes it inconvenient for many people to live there! Land is too expensive for many to live there! And land near towns is often too expensive for many farmers to farm there. We generally kick our farmers far away from cities and towns, with our absence of free competition for land where farming would pay. The same close to a growing town or city is generally held by speculators for city lots in 5 or 10 years, if not in 20 or 30. The rich land gambler can wait very long and never loses anything by thus waiting. It is the safest investment, land gambling, when presided by keen foresight.

Under a healthy civilization we would notice a certain regularity in sections where all land would be under proper use, while others would not yet be used at all. It is a disorderly civilization that gives us the barbaric mixture we have now, of abandoned lots in the center of cities and abandoned or unused broad acres close to towns or in the suburbs of large centers of traffic. All because of monopoly in natural resources, and hence monopoly in labor products.

Is the latter possible without the former, as socialists assert? If so, how? No man can conceive how. No man can explain how the thing is to be accomplished. The converse is a self-evident truth, because we all know that he who controls the source of a stream shall control the channel. A mere dam built up here or there shall deviate the water where he may see fit. Hence those shall control most labor products, most wealth, who shall control most of the source of all wealth, most of the best land from which the wealth is to come, and where it has to be moved, handled, stored up, etc. It has always been so, and

it shall always be so, as long as the laws of nature change not. Socialists themselves shall realize that later on. In the meanwhile let us keep sweet all around. Let us reason, talk and write like men, not like sour old aunties. Let us respect each other as reformers of different schools, and give our readers a chance to form their own final conclusions, instead of attempting to force them to accept our own.

The future belongs to those who want the triumph of truth rather than that of their own school of thought.

#### "WHAT MUST WE DO TO BE SAVED?"

Bob Ingersoll, Bob Ingersoll, I heard you here one night.

As off you rattled fiery talk enough a man to fright; You preached on how we must be saved—'twas doctrine strange to all—

And many thought you Satan, Bob, that listened in the hall.

Bob Ingersoll, Bob Ingersoll, our dear old mothers said,

If good, we'd find a place with God the moment we'd be dead.

And now, when tossed on life's rough sea and sighing for a calm,

You tell us all were foolish tales, and mothers' tongues a sham.

It grated harshly on our minds. In days of callow youth

We felt the words they told us, Bob, were trumpet-blasts of truth:

We dreamt of angels and their wings, and hourly we would sigh

To leave this world in spring of life for mansions in the sky.

Oh, eloquent Bob Ingersoll! I wonder how you dare Express such thoughts before mankind? I don't

know how you'll fare When God shall call your sinful soul for judgment,

Bob, I fear, You'll hear the dreadful charge to slide off downward on your ear.

I know, my bold defaming chap, your doctrine's sure to please

Some wealthy fellows, like yourself, who lie on beds of ease;

But we who struggle hard for bread beneath each tyrant's frown.

Prefer our dear old mothers' tales, that pledged an endless crown.

There's no one, Bob, who can deny but that your brain is bright;

You've only got one grievous fault, your doctrine isn't right.

I wish you'd take a tumble soon, and come our pious way.

Your tongue is just a dandy one to eloquently pray.

If not, my flowery infidel, I fear you yet shall roast 'Way down upon a whirling spit, until you're brown

as toast; Because you thunder forth such lies your audiences among.

Ah, Bob, whatever else you've got, you have a lying tongue.

I wish you'd join our choir above, where I my voice shall raise

To topmost pitch, on Jordan's banks, in songs of endless praise.

Indeed I wouldn't like to hear the devil rattling chains.

To bind you tight for ever more in never-ending pains.

Shandy Maguire.

### BURNING OIL; NEW CRUISERS; STEAM POWER.

Since the article for the June MAGAZINE was written, some interesting facts on the burning of oil as fuel has appeared in the *Engineer*, [London], from which I have taken the salient points, and it will be found varied, as well as very interesting, to all readers. It will be understood by our readers, that there are enormous oil interests in the Black Sea ports of Russia and it is to them that the article refers.

"Although it is true that petroleum in any but the crudest form is an exceedingly expensive fuel, if purchased in England, it is not necessarily costly if purchased in the Black Sea or in the United States." The "Baku Standard," a steamer, is fitted for the burning of oil as fuel, and she is a tank steamer running from the United States or the Black Sea with oil in bulk as cargo for England, she is 3,705 gross tons, 330 feet long, 43 feet wide by 23 feet deep, and her capacity is 1,200,000 gallons of oil.

Only three boiler tenders were shipped, (in place of fourteen firemen and trimmers), one of these met with a fall and breaking his collar bone, the other two had to stand six hour watches in place of the usual four hour watch, the long watch would have been impossible with coal, there appeared to be little trouble with the fires in the worst weather, and they needed but little care, the amount of oil used in a day of twenty-four hours, was twenty tons, equal to forty tons of coal per day, and as a triple engine was used, the fuel was equivalent to 2500 H. P. the engine of the "Baku Standard" do not, however, indicate anything like that amount, but nearer 1500 H. P. [the amount is not given in the article,] a letter from the superintending engineer of the firm who put in the engines says: "the I. H. P. of the same ship with coal is from 1500 to 1800, and the coal used is thirty tons a day of twenty-four hours, at sea." Making this comparison, it would seem that the actual value of oil is only one and a half times that of coal in evaporative power, while it is of greater cost, but the actual cost is not given; but the greatly reduced cost of help in the fire room is cited as a saving, to offset the increased cost of the oil over the coal, up to this point there seems to be a satisfactory condition of affairs, in the new departure, but some important points now appear for our consideration, and in the case of a ship they mean a great cost.

"So far Mr. Stuart [the owner] seems to be contented with the result in all respects but one, and that is the old trouble that has arisen over and over again when petroleum fuel is used in connection with surface condensing engines—a very serious quantity of steam is used in spraying the fuel. This represents so much waste, which is not the worst of the matter. The steam so used goes off into the chimney in one or another form, and the auxiliary feed has to be employed to make up the loss, salt water cannot be pumped into the boilers, fresh water enough cannot be carried, consequently an expensive and heavy evaporating plant has to be fitted up and worked with the liquid fuel. It is easy to underestimate this item, when we say that during the first voyage of the Baku Standard the weight of steam required to spray the oil exceeded that of the oil, reaching over a ton an hour, some idea of what it represents in the way of a loss, may be formed: Allowing 20 pounds of steam per I. H. P., a very liberal allowance, we see a ton of steam per hour means about 112 I. H. P. and allowing a pound of fuel evaporates 15 pounds of water an hour, it means that not less than 3,600 pounds of oil has to be burned each twenty four hours, for the purpose of supplying fresh water to the boilers for forcing the fuel into the furnaces.

It is stated that a different set of burners are now being prepared for the furnaces and it is hoped the supply of auxiliary feed will be reduced to ten tons each twenty-four hours."

My own impressions of this article were at first reading that some mistake had been made in statements, for the amount was so enormous, but on a careful re-reading, it is apparent that the facts are stated, and it is also a very poor triple engine that is allowed twenty pounds of steam per hour, fifteen is large, and this would call for 150 I. H. P. to put the fuel into the furnaces, or or nearly ten per cent of the whole power, which would make a negative quantity of the saving in labor, or feeding the few men required, but this is not all; there is a liability of fire and explosions if any air gets mixed with the fuel on its way from the bunkers to the furnace, and some other questions seem to have arisen in the whole application of liquid fuel, that are not all comfortable even if seemingly economical. It may be that petroleum steamers can use liquid fuel, at some saving, but the saving seems to disappear on a careful consideration of the whole of the circumstances, for a steamer whose whole business is with the oil supply, can put in her fuel while loading her cargo, but a steamer not loading with oil could hardly take in other cargo, or supply herself with such fuel, when in other business, or away from the source of supply

and it might be possible for shippers to have a word to say as to the shipment of their goods in immediate contact with such a cargo of fuel.

The economy of the matter seems to be indirect rather than direct, and it would seem, also that the saving has to be most decidedly proven, before it can be accepted as in any way final or conclusive, the amount of feed water required to provide for the jet, is out of all proportions to the seeming saving and ten per cent. of fuel added to any ship to supply the ship with feed water would at once cause all such consideration to be dropped.

The Lloyds seem to consider it as experimental, and do nothing to interfere with it so far as reported, rather looking on it as something to be decided by further experiment and the final result will be waited for with interest just as all such innovations in regular practice usually are.

\* \* \*

The new U. S. Cruiser, "Olympia," in her trial, the details of which are only lately given, has proved up to all requirements and in excess on speed, she is steel, protected cruiser, 344 feet over all, draft 21 feet 6 inches, displacement 5,872.16 tons, has two triple expansion engines, each having 42 inches high, 59 in intermediate and 92 in low pressure cylinders, with piston valves on all the cylinders, each engine has a screw of three blades, 14 feet 9 inches in diameter, 19 feet pitch, variable, four double ended and two single ended boilers, 824 feet of grate surface and 28,298.64 feet of heating surface, carry 160 lbs steam pressure, speed of engines about 138 revolutions per minute, at full speed, and at full speed made a total of 17,313.08 I. H. P. on main and auxiliaries, all running, used 37,937.5 pounds of best Harris coal per hour, or 2.22 pounds per indicated H. P. per hour, all working included, at full speed, the coal was to some extent estimated, being taken from bags of 100 pounds each—speed under full swing was 21.68 knots after correction.

\* \* \*

Some experimental work has lately been done in the locomotive practice of finding the efficiency of the engine with regard to the expenditure of heat in power, and the results are astonishing to the makers, the claim was made that "nearly .200 of the fuel value would be accounted for in the steam as referred to by Carnot's cycle, or that the range of temperature would show .2 of that efficiency, and this is found by taking the temperature of the steam as it enters the cylinder, for the highest temperature, and the pressure of the exhaust as the final temperature for the range, then subtract the lower from the upper, and divide the remainder by the absolute tem-

perature of the higher temperature or add to the sensible temperature of the steam at the highest pressure 461.2 degrees F. and the result will in all cases be a decimal, which represents the percentage of heat accounted for, of the total heat used or possible to be given out from the combustion of the coal; the pressure carried on this test was 170 steam gauge, or 184.7 absolute, and the exhaust was supposed to come down to 8 pounds by gauge, had this have been the fact the figures would have stood 184.7 pounds, 375° F. and 8 pounds as 22.7 pounds, 234° F. and  $375.0 - 234.7 = 140.3$   $(375 \div 461.2 = 836.2)$  and  $140.3 \div 836.2 = 16.77$  per cent. as the efficiency. What did happen is stated as follows: total steam in the cylinder was 161 pounds initial, or 364° F. back pressure 22.7 pounds, 234.7° F. and  $364 - 234.7 = 129.3$   $(364 \div 461.2 = 825.2)$  and  $129.3 \div 825.2 = 15.66$  per cent. shown by the actual working of the engine under very favorable circumstances, which is far better than usual result, on further trial of the engine it was found on linking her up that the back pressure increased, but the efficiency was considered as high. Taking diagrams from a ship lately, with 165 pounds steam gauge, it gave in the high cylinder a total of 174, absolute, or 370.2° F. and in the low pressure the back pressure was 5.5 pounds absolute, or 166° F. here he have the vacuum, or nearly 75 degrees lower temperature than in the locomotive, and the problem by same rule is,  $370.2 - 166 = 204.2 \div 831.4 = 24.56$  per cent. accounted for in a ship using a condenser, or something near 50 per cent. more than the locomotive gave on same basis: the range of temperature is the precise thing to be accomplished, and it is utterly impossible with our present knowledge to get the same range without the condenser that we can with it.

In some of the high pressure compounds it is supposed that a partial vacuum is made, and it may be true, but what of the blast with no pressure? If we can arrange to have a vacuum to some extent on our compounds, it will add to their economy, as well as to their use for general working. the writer hopes some of our readers will find out how to do it, and profit by his industry.

In the consideration of these subjects, it is always to be understood that a saving in pounds of coal, is not efficiency of heat units to the same extent, or in same ratio, for in carrying high pressure it is easy to get much more heat out of triflingly small additions to the lower pressure than in proportion to pressures as usually compared. If we take water at 212° F. and make it into steam at that temperature, it calls for an expenditure of 1146 heat units for each pound of steam or water made into steam; and if we wish to make steam of 160 pounds, only 1193 heat

units are called for to take water at same temperature and turn it into steam at that difference of pressure, thus it uses up only 47 more heat units to make the same water into 160 pounds of steam pressure, than it does into 147 pounds of pressure or one atmosphere, or about 4 per cent. and it is the fact, though not generally conceded, that the work given out by a pound of steam, depends on the range of temperature it passes through in doing that work, or the work depends on the difference in the degrees of temperature of the steam when it enters the cylinder, and the temperature when it leaves the cylinders, (or one cylinder.)

The working of steam is yet capable of much advance but to understand it we must study its laws, become familiar with them and try to conform to them so far as we can, without attempting to force them into our own ways or ideas of what it should do.

Heat is one of the most interesting of all substances to study as also one of the most profitable when studied aright.

*Thomas Pray, Jr.*

#### ECONOMY.

I see that in spite of the multiplied cylinders and expansions used in marine engines, some of the "ocean grey hounds" use over 300 tons of coal per day, but within the past month a new device, by which nearly 100 tons per day has been saved, (at least that is what was claimed for it) was tried on one of the second rate boats. When it comes to cutting down the fuel bill at the rate of 100 tons a day on a single vessel it is surely worth while to investigate. One obstacle, however, exists to an investigation, and that is that the inventor is not yet ready to be investigated, and keeps his new improvement a secret. Ever since the "Keeley motor" craze, a thing that has to be kept such a profound secret, and is not ready to stand a full and free examination, is apt to create a spirit of doubt, and hence it is not to be wondered that many doubt the claims made and wish to have more than mere assertions before they will believe. This is also the condition in regard to many of the trials made with "compounds" on railroads, although it would appear that the preponderance of evidence gathered here and there seems to show in favor of compounds as fuel savers, and yet it may be that much of this results from superior management of the men in charge, who, knowing that they were expected to show a saving, may have done their best. Some time ago a feed water heater was introduced on some roads and great accounts were given of the saving of fuel on some of the first engines equipped with it, but it seems that none of the newest and best engines get any more of these heaters, and

they are not even kept on some that had them. About a ton or more per day was to be saved by these heaters and as they were not very expensive a big saving should have resulted, but actual practice does not seem to have resulted so well and hence they have fallen into disuse. So it may be with some of the compounds which promise much at the start but whose extra expense may counterbalance any saving in fuel.

Borland tells a story about an engineer taking the switch for the moon, which he mistook for the headlight of Borland's engine and thinks it necessary to vouch for its truth. Now of course I do not know anything about that story of his but it is a fact that some years ago one of our flagmen was roused out of a little nap by the sudden stop of the engine at an unusual place and looking out of the rear window he saw a headlight staring at him. He seized his red light and made frantic efforts to bring the reckless runner following them so close to a stop to find that it was only the moon rising and peeping at him around "Pater-son rocks." If Borland's engineer made that mistake it may surely be possible for a flagman to do the same thing.

At the risk of being called an intruder in the argument which our brother from N. M. seems to be ready to open, I would say that it does seem to me that our brother from Baltimore did give a proper answer when he defined "clearance in a cylinder" to be "the space allowed for the piston to clear the cylinder heads when engine is on the center," and in this view our brother is sustained by all books treating on the subject. Rods are re-adjusted at times and if there was no "clearance" the slightest displacement either way would result in disaster. Our N. M. brother says it is reduced to as small a space as possible, and then he goes on and measures up through the steam passage to the port and valve; and points out the use that clearance is in affording space for compression, and this brings me to the point, that the clearance space with the steam passage and port up to the valve forms a compression space at the end of the stroke. That is the point I believe which Brother Parshall wishes to make by calling attention to the position of the valve and the ports. Most every student of valve motion knows that four and in some cases five actions of differing character take place in each movement of the piston from end to end of the cylinder. In the first place we have admission of steam when the valve is open and the steam rushes in an unbroken stream from the boiler through the throttle valve into the dry pipe and from that to the steam chest and finding the

port open it goes into the cylinder. This action continues until the point of cut off is reached, when the valve closes the port and stops a further inflow of steam. The steam admitted up to this point is now cut off from its source of supply but has still a further power by expanding, which is the second action and takes place until in due course of the valve movement the port is again opened and put into communication with the exhaust port when released, the third action, takes place. But before the piston has reached the end of its stroke the valve again closes the port and the steam that did not go out in the exhaust is compressed between the advancing piston and the cylinder head and also fills the steam passage up to the valve. The fifth action also comes in at this point in engines which have lead, for the steam port opens in that case before the piston is on the dead center, and pre-admission takes place at the same time as compression. If asked: "What is clearance?" I would therefore answer just as Brother Garaghty did, but if asked what use the clearance and the steam passage up to the port and valve was at the end of the stroke, I would answer they formed a "compression space."

*William Weiler.*

#### PROPOSITIONS CONCERNING FIREMEN.

At the March meeting of the New York Railway club Mr. W. G. Wattson, superintendent of the West Shore railroad, submitted some propositions concerning locomotive firemen which created considerable discussion. Mr. Wattson's propositions were: First, The locomotive fireman should invariably be selected from employees engaged in road service. Second, Locomotive firemen should be selected from among the men filling position of head brakemen on freight trains. Third, in selecting firemen the man's promise of becoming a good runner should be the controlling consideration, and that everything else should be subordinate to this essential requisite. Fourth, As a general rule, the fireman who has the least promise of becoming a satisfactory engineer is the one who is selected from the ranks of the engine wipers.

With regard to his second proposition, Mr. Wattson said: "This proposition anticipates that the position of head brakeman on freight trains shall be filled by men who have been especially selected with reference to their fitness for firemen, and that while they are filling the position of head brakeman they will be on probation or trial for the purpose of ascertaining as nearly as possible whether they are the right kind of timber to grow up to be engineers or not." In view of the fact that practically all of the locomotive engineers in this country now come from the ranks of the firemen,

and that the great majority of firemen ultimately become engineers, it may be said that these propositions have reference to a process of selection for the purpose of securing the best class of engineers attainable, and they may all be simmered down and their essence presented in the single question: How shall we obtain the best material out of which to make satisfactory locomotive engineers? That it is possible to confine such material within the ranks of a single class of employees is a proposition that may well be doubted; embryo engineers are liable to be found in the ranks of many other classes of employees besides those engaged in road service, and any objections they might have to entering into a period of probation as head brakeman on freight trains should not be allowed to affect their chances of eventually becoming engineers. Firemen should, undoubtedly, be selected with a view to their fitness to become good engineers, but that head brakemen should be selected with a view to their fitness to become good firemen and so good engineers, is a proposition that is open to argument. It seems to me that that is separating cause and effect by too much of an interval to always produce good results. The essential qualities of a good engineer may often be found in those who are filling the position of head brakemen, and it is certain that such men make good firemen and should be given due recognition when selecting men for the position of firemen; but it is also true that there are many men in other branches of the service who possess the necessary qualities of a good engineer in the very highest degree, and who would never apply for the position of fireman when a period of probation as head brakeman on a freight train was staring them in the face. The process of selection might, here, defeat itself; what was gained in one way would be lost in another. The position of head brakeman on a freight train is not, by any means a pleasant position to fill, and if the brakeman properly attends to the duties he is paid for attending to he hasn't time to obtain much more than a general knowledge about firing a locomotive. The acquaintance with the road which the brakeman necessarily gathers while performing his duties is a good thing for a fireman to have; but if this was the principal thing for the fireman to know it would, indeed, be fortunate, as the fireman who is capable of being a fireman, and so an engineer, may acquire such necessary knowledge as this in—well, say, three trips. Those who are capable of becoming good engineers may be selected from the ranks of the firemen by following out an intelligent system of progressive examination; and the poor material should be weeded out at least once a year; to be replaced by other material which has

been subjected to the ordeal of a rigid preliminary examination. No favoritism whatever should be allowed to enter into this process of selection,—and this is a matter that should be well understood by all parties concerned—and, although employes should be given the preference over other candidates for preliminary examination, the question of what particular branch of the service they came from should not be allowed to enter into the matter at all. The wiper, or other employe, who is capable of passing a proper examination, is just as liable to develop into a first-class engineer as is the head brakeman on a freight train; in fact, some of the very best engineers in this country began their railroad experience as wipers in a round house. "What's bred in the bone will come out in the flesh." It don't make much difference where you put a man whose make-up contains the essential qualities of a good engineer, those qualities will stay by him; and, by the way, those qualities are just as necessary to his success in many other vocations in life as they are to his success in locomotive engineering. First-class firemen, the making of first-class engineers, may be secured by inaugurating a system of first-class examinations; and, not the least point to be remembered is that first-class men cannot be induced to undergo the ordeal of a first-class examination, when the reward contingent on their passing such examination is second class wages.

We have a new order, the order of "Associated Railroad Men," launched upon the troubled sea of railway affairs by Mr. Daniel Breck, roadmaster of the L. & N. railroad at LaGrange, Ky. Mr. Breck, assisted by one J. M. Hall, as stated in an address to "fellow employes," has come to the conclusion, or conclusions, that "the railroads of this country are in a bad fix, and that we must set ourselves to help them out." Just exactly what the nature of the "bad fix" is, that forms a part of his profound conclusion, Mr. Breck does not state very clearly; but it has something or other to do with freight rates, and the "anti-railroad people" who are doing their best to ruin the railroads, and their employes along with them. Mr. Breck believes, with President Perkins of the "Q," and General Manager Ashley of the Wabash, that the woes of the country may all be traced to the reduced earning capacity of the railroads, and that if they be relieved from oppressive statutes and be allowed to restore rates to the old time basis, wages will increase, prosperity will once more spread her wings over an afflicted country, and a God may once more be found in forsaken Israel. Breck states a most profound truth to his fellow employes when he says that "we cannot get

blood out of a turnip." That reminds me of the remark made by the man whose friend had remarked on the size of his room, that it wasn't big enough to swing a cat in. "But, my dear sir," was the reply, "I don't want to swing cats in this room." The great beauty of this new order is that it is going to be just as free as the air we breathe; it isn't going to cost a single red cent to belong to it. All that is necessary to do is for three persons to form themselves into a "Chapter" and then write to Breck for a copy of the constitution, and "further particulars as to the aims and methods of the association." Breck's peroration is worth quoting:

In order to join our society no one need leave or be unfaithful to his own brotherhood. He will instead by joining us be best serving his brotherhood's interests. If we make our companies prosperous, will we by doing so hurt your brotherhood? We will have no secrecy and no pledges. Bound together by a common interest, the common good will be our law. Our general offices will be in the nature of a bureau to gather information for us, keep us advised of what is best to be done, and by giving united, consistent and vigorous action, enable us to help our companies and ourselves and to put down our enemies. We have seen to what straits our companies have been reduced, and have learned the necessity of giving them our support.

Organized for a laudable purpose, allying ourselves with the right thinking part of the community, what an organization ours will be. The people of the country at large, as well as every railroad employe, from the president to the water boy, will be interested in our success. To the community at large we will mean the return of the huge transportation interests of the country to a normal, rational and solvent basis, with a great incidental advance toward general prosperity. Boards of directors and stockholders will welcome us, for to them we mean the salvation of their possessions from confiscation. Presidents and general managers will join with us, for to them we mean the success of their policy and the strength of their administration.

The anti-railroad lawyer will have to make an honest living. Railroad commissioners will have to know something about railroads. The people will be shown the meanness with which their officers have truckled to the prejudices of the people themselves, and will despise them for it and will repudiate them.

Our ends are just and reasonable. We are 1,000,000 strong. We have our votes to cast, our wages to spend, our patronage to bestow. Injustice and oppression will have to reckon with us. And with such a bulwark interposed between it and confiscation, capital will again seek its accustomed channels in railroad building, improvement and operation.

It is, of course, the very worst kind of bad logic to say that this new order ought to be condemned simply because the *Railway Age* is in favor of it and has strongly indorsed it; but that fact furnishes presumptive evidence that there is a good sized African concealed in the wood-pile, and employes will do well to think a couple of times before landing with both feet into the order of "Associated Railroad Men."

G(rand) M(aster) Pullman, chief of the Sleeping Car Conductors and Porters of America, is out with a general order to Assistant Chief Garcelon, as follows:

It appears that of the conductors and porters now in the employ of this company 650 have served five

years or over, as shown by the following list. Conductors—131, 5 year; 25, 10; 11, 15; 11, 20; 1, 25. Porters—331, 5 years; 91, 10; 31, 15; 15, 20.

I desire that a proper expression of the company's appreciation should be given to those who have served it thus long and faithfully. In considering the form which such expression should take, it appears to me most appropriate that it should be one which will not only be apparent to all with whom the recipients come in contact in the performance of their duties, but will also be an incentive to their fellow employees.

With these objects in view, it has been decided to award to each of such employees who have served for five years a "badge of honorable service," to be worn upon the left sleeve of the uniform, and to consist of an embroidered bar (gold for conductors and silver for porters) and a similar bar for each additional five years of service. As a further recognition the company will present to each of the conductors or porters who have served ten years or more two uniforms per year while they continue in service.

I will be glad if you will arrange to carry out these suggestions as soon as practicable.

That is a very nice thing for the G. M. to do, these hard times; and it is gratifying evidence of the prosperity of the order. It shows that the conductors and porters are paying their dues regularly, notwithstanding the hard times. This is a measure which the many other grand chiefs throughout the country would do well to imitate. If a system of gold and silver bars and free uniforms could only be generally adopted it would do much to restore harmony where contention now prevails, and might reconcile the contentious ones to some further "necessary" reduction in wages.

W. P. Borland.

#### Emergency Application of Brakes.

MR. EDITOR:—There seems to be a prevalent belief among some engineers handling air, that in order to obtain the emergency application, you must make a quick reduction of train line pressure of 10 or 12 pounds, so that the piston of triple valve can take a run for the graduating spring and compress it. Of course the graduating spring must be compressed before an emergency application can be had, but the weight of piston or the distance it travels from the release position to the graduating stem, cuts no figure in the case at all. The object of making a quick reduction is to get sufficient pressure out of train pipe in order that the difference of pressure in auxiliary reservoir might be great enough to compress the graduating spring before much air escaped to brake cylinder. That is the reason that we are instructed to make the reduction quickly, if it was to derive pressure from the momentum of piston as so many believe the graduating spring could be made weaker and we could still get the emergency by a slow application. The feed port leading from the auxiliary to brake cylinder is small as compared with the opening of train pipe to atmosphere through the emergency opening in the engineers valve E. in order to get the pressure out of train pipe as above stated. In reply to Mr. Willis as to

breaking a side rod on an engine where the eccentrics were on one axle and the main rods connected to another, you would have to be towed in. When you brake a side rod, on the class of engine you speak of, the other rod would have to be taken off, and both main rods would do you no good, as they are not connected to the same axle that the eccentrics are. The Forney elevated engines are connected the same way the eccentric on the front axle and the main rods connected to the back axle (pin) and if you brake a side rod on this class of engines, you would have to be towed in.

BALTIMORE, MD. *Walter C. Garaghty.*

#### Referring to Engines With Eccentrics on Lead Axle.

MR. EDITOR:—Ten-wheel engines, with eccentrics on lead driving axle, may be run with one side, in case the eccentric-rod or strap breaks, in the following manner: Take down main-rod on broken side; cover the ports with valve; clamp valve stem to clear the rocker arm, and block piston at one end of cylinder. Engine is then ready to move with one side, with all the train she can haul. But, in case a pin or side-rod on such an engine is broken, we must take off both main rods, and all side-rods from both sides: disconnect valve rod from rocker arm; place valves over ports and clamp valve rods to clear rocker arms; block pistons at one end of cylinder. She is then what one might properly call a dead engine, and ready to be towed to the shop.

READING, PA. *T. N. Rothenberger.*

#### Differences in Brake Valve and Piston Travel.

MR. EDITOR:—Mr. Harrell says that there are two positions of the brake valve, lap and emergency, where there is no communication from train pipe to air gauge. With regard to lap position he is correct; but with regard to emergency position it will depend altogether on the style of valve used whether there is communication or not. When the (C.) valve with perforated piston, or the E 6 valve are placed in emergency position there is communication from train pipe to air gauge. The E 6 valve as first made had no communication in emergency position, but, later the Westinghouse Company extended the port (P.) in the rotary so as to allow the air to escape from the little drum, through the preliminary exhaust port. With regard to differences in piston travel, the piston having the longer travel will release first; but it will take the longer time for the air to escape from the cylinder having the longer piston travel. The larger volume of air requires a longer time to escape through a quarter inch port than does the smaller volume. From *Locomotive Engineering*, I noticed a question relating to a frequent trouble when the brake valve is

left without proper care. "Train was coming into station and engineer put engineer's valve in service stop and brakes would not work, piston 17 was not stuck. Put handle to emergency position and brakes worked all right." This might have been caused in three different ways: 1st, by the gasket (61) leaking through from train pipe to top of piston 17, when, as fast as the air was drawn from the top of the piston the train pipe would supply it through the leak; 2nd, the gasket may have swelled so that piston 17 could not rise; 3rd, the preliminary exhaust port could have been stopped up.

COVINGTON, KY.

P. P. Haller.

#### For Information.

MR. EDITOR:—I wish to ask for information through the Mechanical Department of the MAGAZINE. What changes are required in a locomotive to adapt her to the burning of coal and also to the burning of coke. I have reference to front end grates, etc., and hope your contributors may furnish the desired information.

MINNEAPOLIS, MINN.

T. I. Weldon.

IN Europe Corliss valves have been fitted to locomotives. At the present time, there are eleven engines on the Paris and Orleans Railway fitted with Corliss valves, one at each corner of the cylinder, actuated by a Gooch link motion having an extra deep die block, to which "two" radius rods are jointed one above the other. The upper of these radius rods actuates the exhaust valves and the lower one the admission valves, from which it will be understood that for all positions of the reversing handle in forward running, the periods of release and compression are comparatively late and the cut off comparatively easy, while in backward running the reverse obtains. As an engine spends most of its time running forward, this latter is not very materially objectionable, while the improvement in forward running is likely to be considerable; in fact, compared with engines fitted with the ordinary slide valve, the saving in coal is stated to be 15 per cent.—*The Engineer*.

THE city authorities of Chicago produce figures to show that they can make and deliver gas to the citizens at 80 cents, and cover into the city treasury \$2,000,000 a year in the transaction. By and by those who dwell in cities will find out what great frauds the gas companies really are. Taken at an average, the residents of cities in this country are paying twice as much for gas as they should pay, yet when anything is said against such extortion it is called "howling" or something equivalent.—*American Machinist*.

#### The Action of the Injector.

Notwithstanding the fact that much has been written upon this subject, the action of the injector still appears mysterious to many of those to whom it is a familiar object. It is strange that the reason for its working is not more generally understood, even by those accustomed to operate it daily, especially as this method of feeding is now so universally employed for locomotive and stationary boilers.

The simplest method of considering the theory of the injector is to eliminate the more complicated sides of the question, and consider it solely from a mechanical point of view; simply as an apparatus in which the momentum of a jet of steam is transferred to a more slowly moving body of water, producing a resultant velocity sufficient to overcome the pressure of the boiler.

The high velocity attained by a jet of steam has been calculated, and diagrams have been given that show the fall of pressure and increase in velocity as the volume is increased according to the laws under which the steam expands. Suppose that a nozzle connected with a reservoir containing steam at 120 pounds pressure discharges 1 pound of steam per second; at this minimum diameter the steam will have reached a velocity of 1,407 feet, but when the terminal pressure is 22 inches vacuum the velocity will be 3,446 feet per second. Let us suppose that this jet flows into a combining tube, which is able, by means of the great conductivity of its walls, to abstract sufficient heat to completely condense the steam at a final pressure of 22 inches, or 4 pounds absolute. This reduces the steam to a solid jet of water having a cross section  $\frac{1}{4}$  the area of the steam while passing through the steam nozzle, and yet does not in any way affect the velocity, as the contraction of the jet is entirely lateral. A jet of water issuing from the delivery tube, forced out by the pressure of the boiler, would have a velocity nearly equal to that due to the head, or approximately 133 feet per second, only  $\frac{1}{5}$  of that of the jet of condensed steam. But an injector is required to perform useful work, forcing a supply of feed water into the boiler; therefore a certain weight of feed water must be added which will take the place of the cold walls of the tube for the purpose of condensation. This mass of water receives the energy of the moving steam, condenses it, and the two fluids move along together through the delivery tube with a terminal velocity greater than a jet of the same density issuing from the boiler. If the weight of water supplied is too great, the steam will not have power enough to give the required velocity of 133 feet; if there is an insufficient supply, the volume of the steam will not be reduced sufficiently to pass

through the tubes, and in neither case will the injector work properly.

Turning again to figures, and taking the simplest possible case, we can follow the steam through its whole course within the tubes, and determine the relation of the different parts of the injector. As the velocity and volume of the steam at the instant of passing the minimum diameter of the steam nozzle are 1,407 feet and 5.05 cubic feet respectively, and after complete expansion in the combining tube 3,446 feet, and 74.2 the cross section of the steam jet at that time must be:

$$\frac{1407}{3446} \times \frac{74.2}{5.05} = 5.99$$

times the area of the steam nozzle. During complete condensation the volume of 1 pound of steam shrinks from 74.2 cubic feet so that the cross section of the jet after condensation is:

$$\frac{0.016}{74.2} \times \frac{5.99}{1} = \frac{1}{774}$$

the area of the steam nozzle, so that the jet of condensed steam would pass through an orifice  $\frac{1}{774}$  the area of the steam nozzle at a velocity of 3,446 feet per second.—*Engineering Mechanics.*

#### Air Space For Boiler Furnaces.

There has been considerable talk and private discussion regarding the statement made by Mr. F. A. Scheffler in his paper before the American Society of Mechanical Engineers that he had successfully run a Stirling boiler with a grate having only 15 per cent. of air space, and in view of the amount usually considered necessary, it is not strange that this was questioned. But we are very apt to either forget to note down what has been done in the past or to overlook it, and it often leads us into error by answering before we have really looked the case over. It may be interesting in this respect to look back at a little railroad practice which has gone on record and see what has been done, not forgetting, however, to make allowances for the forced draft in this case. On the Delaware, Lackawanna & Western railroad, in about 1856 or 1857, they were running wood-burning locomotives having a fire-box about 60 by 66 inches, and this was all blank at the bottom except a grate of about 18 by 24 inches near the center of the fire-box, having probably about 50 per cent. air space through it.

This gives between 5 per cent. and 6 per cent. of air space for the whole fire-box, which is rather a low percentage, although wood as a fuel and forced draft account for much of this.

On the New York, Providence & Boston railroad there were, between 1860 and 1870 grates in use which would be laughed at now, and probably not given a trial, because "any one knows they would never do" but

they did. These consisted of plain flat cast plates, having round holes through them, about one inch in diameter and probably two inches between centers, making about 20 per cent. of air space.

These were used on account of durability, freedom from warping, etc., and were used very successfully for a number of years, there being no trouble whatever from lack of draft or steam from the boiler. Why they were abandoned it is hard to say, but presumably, as with many other things, they gave place to others which were just as good or no worse, and new things are often considered better by the majority.

We cannot always tell why old things are abandoned and replaced by others, and we are safe in saying that it is not always merit that does it.

As an example of this I may mention a certain railroad whose chief official convinced the directors that the engines they had were not economical nor fit for the work, and had some others built on the monstrosity plan.

These engines were put to work on the same runs, and it so happened that one of the old ones was pressed into service on a similar run. This continued without comment for nearly two years, when some of the observing engineers began to see and comment on the fact that the old engine was doing more work per pound of coal, and had not been in the shop for repairs in all this time, while the new engines, the "economizers," had been laid up half a dozen times and were burning more coal.

This got to the ears of the chief officer, who ordered the new engines, and the old engine was hauled off that run in a hurry, as he evidently was of similar mind with Mrs. Malaprop in "The Rivals," that "comparisons are odorous."

I do not mean to say that this was the case with the grates mentioned, but there are too many cases where the old machine is declared a failure so the new one can have an excuse for existing.—*Fred H. Colvin in American Machinist.*

The Bessemer invention of steel was made in 1855 by a student in his laboratory. He propounded his idea to the world, but it took fifteen years before it was successfully put in operation. I know Mr. Bessemer very well. He is a modest man who never sought to make a fortune, but he has taken the rewards of his great invention, and he told me the last time I saw him in London that he had got out of his invention nearly \$10,000,000. The contribution which he made to the world by that invention in the saving it has effected in the ordinary operations of society is simply incalculable. If I were to say we were saving \$1,000,000,000 a year in this country alone as the

result of that invention applied to every branch of industry, particularly in the transportation of the goods and products of the country, I should certainly underestimate the amount. And now I am going to say something even more surprising. Taking the world together, the saving effected by that invention is greater than the total value of all the movable capital of the world one hundred years ago. One man, by a single invention, has contributed to the aggregate wealth of the world more value than existed fifty years before his birth. Now he has got ten millions of dollars. It is a great sum. He will leave it to his children, who have done nothing, have contributed nothing, to the acquisition of his money. Whom has he robbed? Whom will his children rob? Who would be the gainer if he had never received one penny for his great discovery? How much would the distribution of his \$10,000,000 over the face of society add to the fortune of any single individual, and how much has his invention added to the fortunes of all mankind?—*Abram Hewitt.*

THE fact that after years of experience in counterbalancing engines in locomotive practice, the matter is far from being settled, would rather rationally lead to the conclusion that there was something to be learned in regard to counterbalancing generally. It is impossible for a force to act *instantly*—there is no such thing as instantly in mechanics—and perhaps the counterbalance is not properly placed. However this may be, we believe that in high-speed engineering the whole matter of counterbalancing is tentative—a little more or less makes the engine run about right, and a little more or less goes. Perhaps putting the counterbalance a little further ahead or behind might produce better results, but the exact location would, in all probability, be so controlled by spring of parts and conditions of rigidity that just what to do with it must be determined by trial. It is rather evident that there is more in counterbalancing a steam engine than has been dreamed of, in philosophy.—*American Machinist.*

THE use of primary batteries for telegraphy has almost died out in our large towns. In New York more than 30,000 cells have been replaced by dynamos. At Boston, 10,000 cells, costing probably \$20,000 a year to maintain, have been replaced by current derived from the electric light mains, at a cost of \$3,000 a year. In this city the Western Union Company have a special plant of fifty-one small dynamos; in Chicago they have forty-six. In England it has been found that accumulators give far better results than dynamos, especially for high-speed working.—*The Engineer.*

ONE of the dangers of private railway ownership was asserted in a recent lecture by professor Bemis, of the Chicago University, to be "the tendency to corrupt legislatures, councils, courts, assessors and other agencies of influence by passes and direct bribes, which are often demanded of the roads by corrupt officials." The professor appears to have reversed things. It is "corrupt officials" who try to corrupt the railways, it seems, by demanding bribes; and therefore the people ought to turn their attention to electing representatives who are not of a corrupting disposition. There is no danger from the railways if law makers and law executors are honest. In fact, it is the railways that need protection. In view of the extraordinary restrictions which legislation has thrown about railways, extending even to fixing the rates which they may charge and prescribe the expenditures which they must make, the suggestion of their corrupting legislatures is almost humorous. That bugbear has vanished, and professor Bemis should not try to frighten by its memory.—*Railway Age.*

#### Removal of the Ferris Wheel.

The Ferris wheel is to be removed from Jackson Park, Chicago, to New York City. The work of removal has begun, and the site selected for it in New York is a large lot, now used for various purposes, but containing no building, at Broadway and 37th street. The location is well chosen, being in the heart of the theatre district of the city, where all visitors and lovers of amusement frequently congregate. The job of tearing down, transporting and re-erecting the wheel will consume four months, and cost \$150,000. The material will be loaded on five Illinois Central trains of 30 cars each. The car which carried the great Krupp gun will transport the 70-ton axle. There is 2,000 tons of metal in the wheel, and 500,000 feet of timber is needed for the falsework.—*National Car and Locomotive Builder.*

A FRENCH engineer, M. Du Bosquet, says that French express locomotives weigh about 1,581 lb. per indicated horse power developed at their maximum power. Taking this ratio, an engine to draw a train of 100 tons at a speed of 75 miles an hour up a slope of 1 in 200, would weigh 150 tons, and generate 2,000 h. p. The maximum possible speed attained with such an engine and train up the slope would be 87.5 miles per hour. The engine would weigh 670 tons, and would generate 8,932 i. h. p. If M. Du Bosquet's reasoning is sound, there would seem to be little prospect of any further great advance in railway speeds so long as steam locomotives are used to furnish the motive power.—*The Engineer.*

## WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER..

Letters for publication should be directed to Mrs. Ida A. Harper, Stanford University, California.

### EDUCATION AND MARRIAGE.

Several of our correspondents have asked for an opinion in regard to the effect that the higher education of women will have upon matrimony. This is a question that is everywhere being seriously asked. Statistics show that there are over 40,000 girls and women in the colleges of the United States. This number will never grow less but will be constantly increased. In the average family, nowadays, there is just as much expectation that the girls will go to college as that the boys will go, and as we have always looked upon every girl as a future wife, the query naturally arises, "How will this higher education affect her matrimonial prospects?" The same question was asked when girls first began to enter the High School, but that was so long ago we have almost forgotten it. In all towns which support a High School, it is expected that the girls of energy and ambition will take the full course of instruction, and the young man of intelligence will prefer them to girls without education. He would be ashamed of the latter. On the same principle, as we have said before in this department, the college-bred man will want a college-bred wife. This disposition on the part of men will increase as a college education becomes more common among women. A century ago the most eminent men were not ashamed of ignorant wives, because all women were ignorant. Now we ridicule the wives of our prominent men if they are ignorant, because our standard of woman has changed.

To a man of education or of wealth it does not detract from a woman's chances if she have no domestic accomplishments. The first marries a woman, usually, for an intellectual companionship, and if she cannot be both educated and domestic he will prefer the former. The wealthy man does not expect his wife to work and will not consider it any drawback if she does not know how to do it. Both would be pleased to have their wives competent to manage a household, and, in fact, expect them to learn to do it, but do not think it vitally essential. It is much more necessary that the man of small means should marry a wife who understands work and is willing to do it, as the welfare of the family will depend largely upon her. We do not believe, however, that any man who really loves a woman will give up marrying her because she cannot cook and sew. He will

have the woman he loves, and will trust that she will be able and willing to help share the duties of wedded life. The statement can be made and proved, we think, that a woman's domestic qualifications rank only secondary in the opinion of the man who loves her and wants to marry her, even though they may play a very prominent part afterwards. We venture the opinion also, that, while a man may be ignorant himself, he is proud of an educated wife.

As far, then, as the men are concerned, an education on the part of women will be no bar to their matrimonial prospects. The other phase of the question is, "What will be the effect of this higher education on the women, themselves, as regards marriage?" It will have to be admitted, we think, that it will have a tendency to decrease the number of marriages. There are several reasons for this: The woman who spends four or five years in college, studying the best authors, coming in contact with teachers of high moral character and fine mental attainments, and viewing life from a serious standpoint, is apt to form a very lofty idea of the future, and to have definite opinions of the work she ought to do and the use she ought to make of her time and attainments. She is not opposed to the thought of marriage but she is not willing to make it the chief aim of her life. She has a noble conception of a husband and when she finds her ideal she will accept him with all her heart, but she will not take a poor substitute. Meanwhile, she is not going to sit idly at her chamber window and watch for him to come down the road. She is capable of active, efficient work which is worth its equivalent in money. Usually she finds congenial occupation and she enjoys, to the fullest extent, her financial independence. She does not have to give herself to some man, an unloving wife, for the sake of food, shelter and clothes. She can afford to marry for that highest of all considerations, for the only one, indeed, that ever should cause a marriage—pure, wholesome love. She will be a better wife because she was a free agent in making the choice and the contract. She will be a more capable wife because of her discipline, her knowledge, her self-reliance, her valuable experience. I believe that the educated woman, as a rule, makes a far more efficient wife than the uneducated woman. Should she never find her ideal, a life of spinsterhood is far more creditable than a loveless marriage; and it is infinitely preferable that she should be fitted for some work that the world needs and that will give her a comfortable income, than that she should be dependent upon relatives to whom she must render services worth double what she receives for them.

To sum up, in brief, the opinions of those

who have observed and thought much on this subject—the higher education of women will result in fewer marriages but in more satisfactory ones; it will make women happier because it will give them a choice in the kind of a life they may pursue; it will have an infinite influence in elevating the standard of men, because every true man wishes to fulfill the ideal of good women; for men, in general, love women and want to marry them, and, whenever it becomes necessary, they will conform their lives to meet the requirements established for them by these women.

#### UNCHANGING HUMAN NATURE.

We are told that this is a world of change and that it is through this change humanity progresses. Evolution is the changing process of unchanging laws. We seize upon the last part of this sentence and apply it to human nature. All else may change, we say, but there are certain attributes of men and women that are carried from generation to generation. I have never been so vividly impressed with the truth of this as during my past year's experience at the University. Two decades have passed away since my own brief college life, which was terminated by an early marriage, but countless times during the past nine months the score of years has seemed blotted out and I have been back again on the old campus, with all its sweet associations. All parents, to a greater or less degree, live their lives over again in their children, but this is especially the case where one shuts out all the rest of the multitude and is surrounded by the peculiar atmosphere of the college life, a small existence within itself, with its own peculiar environment and conditions, and very little affected by the great, teeming world outside, with its cares and burdens, its harassing problems and human tragedies.

How many times during the past year I have smiled or sighed at the repetition of the old, old story! How many things have seemed perfectly clear when viewed through the light of recollection! How often the reproof has died on my lips because of the soft whisper of remembrance! I hear the same lamentations over the long lessons and hard examinations. I see the students wasting precious time during all the semester and then, at the last moment, burning the midnight oil and studying themselves into a nervous prostration in order to secure the necessary "credits." I see all the panorama of the emotions again unrolled—love, jealousy, hatred, revenge—yesterday, the region of heavenly bliss; to-day, the depths of hopeless despair; to-morrow, back again on the delectable heights! I see the little flirtations, the long walks by the lake and through the woods, the afternoons in some

shady nook, with Moore and Byron, those perennial college classics, the moonlight conferences on the steps or over the gate, the tender missives containing the same declarations, made in almost the identical language that delighted my heart in the long ago; facsimiles almost of those that my mother also had laid away, tied with faded ribbons and fastened with little diamond-shaped seals, containing a loving verse.

These things are the fragrance of college life, its poetic charm. Without them it would be dull and arid. I cannot understand the spirit that condemns these innocent pastimes. I do not envy that person in whose existence they have had no part. I look with much indulgence upon the vagaries of the boys and girls. They honestly believe nobody else ever had such troubles or such delights. They believe their experience is entirely new and novel, and they have a profound pity for us older people, who have finished all such pleasures. Well, we feel very sorry for ourselves, when we think they are ended. These youths will never be young but once, let them drink to their fullest capacity the overflowing cup. When they have become mature men and women, every joy which comes to them will be clouded with the remembrance of some sorrow. No day will be wholly free from its recollections of broken friendships, of the loved ones gone out of life, of disappointments, of toil and struggle. Youth is the only time when we can give ourselves up unreservedly to such happiness as comes only when unvexed by memories of the past, undisturbed by forebodings of the future. Let us rejoice that human nature does not change, that our children can have their studies and their sports and their friendships and their love affairs with the same zest and enjoyment as did their fathers and mothers. There are no improved versions of the old story. We would be glad to spare them many of our experiences in later life, we would like to have them avoid some of the mistakes of our own youth, but, since that cannot be, we will not ask, we do not want, any revised editions of the old-time boys and girls.

#### THE SUFFRAGE MOVEMENT.

As the matter for the July MAGAZINE must be prepared in May, it is impossible to tell the results of the New York constitution convention, now in session. As we have stated before, a strong effort is being made to secure a woman suffrage amendment, but its most earnest advocates are by no means sanguine of success. It would be almost too much to expect so great a revolution in so large and important a state. A splendid campaign has been made, however, and its educational value will be felt here-

after. One of the peculiar features is the opposition that has been developed among certain women. These "remonstrants" have assembled in force at Albany, opened headquarters and are making speeches, electioneering and pursuing the very methods that they condemn the suffragists for. The "remonstrants" are said to be mostly women of the so-called aristocracy, who do not want to soil their fingers with the ballot or come in contact at the polls with their humble sisters. Most of us can hardly understand the spirit of women who can sit on the platform and in the audience and approve of resolutions protesting against equal suffrage because "women are qualified to vote." We are willing they should speak for themselves, but some of us think we are as well qualified as the mass of immigrants who land at Castle Garden and become voters within six months. However, it is something accomplished when women are roused from their indifference and apathy and made to think on this important subject. The women of Brooklyn have issued an address to the constitutional convention, saying that they pay taxes on \$104,000,000 of property and they want some representation. Opposed to all the efforts for woman suffrage are the solid phalanx of the liquor, gambling and general "sporting" element which is so powerful in all the cities of New York state, the narrow-minded conservatives who prefer to have the world stand still, and the masses of the indifferent, who, not being for a thing, must necessarily be counted against it.

Since our last writing, the legislature of Ohio has conferred the school suffrage on the women of that state. This is an entering wedge and shows a recognition of the principle that women are entitled to vote. This makes twenty-three states in which women have school suffrage. During the months of March and April three states, Kentucky, Iowa and Ohio conferred a limited suffrage on women.

Kansas is in the midst of her campaign. An amendment, giving to women the full presidential suffrage will be submitted to the women of that state in November. A number of prominent speakers are canvassing the state, holding 100 two-day county mass meetings. The statement is often made that "women can have the suffrage whenever they want it," and yet not one woman in Kansas will be allowed to cast a ballot next November to say whether she would like to vote or not.

The women in Kentucky are in a state of great excitement over the candidacy of General Breckenridge for re-election to congress. They are holding meetings, sending in petitions, passing resolutions, etc. How much effect these may have it is impossible to say, but one thing is certain, if the women

of General Breckenridge's district could vote their opinions, he would not have a ghost of a chance. Of course a number of men will vote against him, but whether enough of them will do so to insure his defeat remains to be seen. Will the better element of men never realize the necessity of calling women to their aid in securing purer politics?

#### EDITORIAL NOTES.

In an obituary notice of a well-known woman who was for many years a member of the Board of Education, the following paragraph occurs:

"For years she was a weekly, often daily, visitor to the schools, and both teachers and pupils will long recall the quiet manner in which she would enter the school-room, take some vacant desk, and, with knitting in hand, remain for hours a keen observer of all that was being done, and many a young teacher will recall with gratitude the kind word of praise that always came in due time."

This is what we need on our school boards, some one who can give a careful, personal supervision of the work and attention to individual teachers. The average male members of the boards serve their terms and step down and out without ever having entered the school room or known the teachers by sight. They have no individual knowledge of the methods employed, of the special needs of the children, of the personal fitness of the teachers. For these and many other reasons we need a representation of women on our school boards. They have more time to give to visiting the school rooms, looking after the heating ventilation, etc., they understand better the kind of training children need, they can confer more confidentially and sympathetically with teachers, they understand as well, and in some cases better, the judicious and economical management of finances, they are, as a rule, much more interested in the education of children. It is a mistake to have kept women off of our school boards for so many years, one which should be rectified at once. There should be a representation of women on every Board of Education in the United States.

\* \* \*

Charles Ritch Johnson, an enterprising newspaper man of Toledo, has collected a large number of opinions of eminent women on the question, "Do you wish you were a man?" The great majority answered in the negative, in fact the affirmatives were almost too few to be counted. The test was not a fair one, however, because the ladies interviewed were almost all engaged in literary work, and literature is one of the very few occupations in which it is not an especial disadvantage to be a woman. The pay is about the same and the disabilities of sex do not interfere with the opportunities for work, as is the case in most kinds of business. Many women engaged in lit-

erary pursuits can do their work at home; others do not have to go outside of their offices. The woman reporter, who must go out in all kinds of weather and to all sorts of places, would find it an advantage to be a man. If the women in other professions and in the various wage earning occupations were given an expression, they, doubtless would express themselves as preferring to be a man. We believe that summed up, the case is about this: she who is allowed to live the purely feminine life, provided with an agreeable home, the comforts of daily existence, protecting care and loving kindness, is satisfied to be a woman. She who is denied these things, who is forced to enter the crowded ranks of the bread-winners, who is deprived of the domestic pleasures that women naturally love, rebels against her sex and would like to be a man. She believes that the struggle would not be so hard, she craves the independence, the freedom from surveillance and criticism, the larger opportunities that men enjoy. This is perfectly natural, and not to be wondered at. There are many pleasures in the life of a woman who is permitted to devote herself to her home and children and is not harassed by outside affairs, but when she is compelled to abandon her own work and take up that of the man, or, worse still, when she is forced to try to do both, she cannot help wishing to be a man and have a better chance.

\* \* \*

At the recent commencement exercises of the Southwestern College of Homeopathy, at Louisville, Ky., more than one-half of the fifty guests at the banquet table were women, and a number of them responded to toasts. Through one of the addresses it was learned that "out of eighteen homeopathic colleges in this country, fifteen admit women." All of us can remember the intense prejudice that existed against "women-doctors" when women first began to enter the medical profession. That was comparatively few years ago, and yet now there is scarcely a city in the United States that has not its woman-physician. The prejudice has not entirely died away, but they can now enjoy all necessary opportunities for obtaining the education, and they stand a fair chance with men in securing a practice. It seems an eminently suitable occupation for women, and the next generation will wonder why they had to fight for the privilege of adopting it. But the next generation will find many things in the history which the present generation is making, to excite their surprise, if not their contempt.

The new Director of Police, at Cleveland, Ohio, has abandoned the infamous state

regulation of vice, as conducted by Pollner, his predecessor. Director Herbert says: "I am not in favor of condoning crime or of setting up two standards of morality. Men who visit disorderly houses will not be assured of protection by my sanction. There will be no more medical examinations of debased women to guarantee the safety of men." Cleveland is thus relieved of a most disgraceful system, and she owes it to the women of the city. They were supported, of course, by the best men, but the women led the movement with vigor and persistence, hampered as women always are by the fact that they could not back up their petitions and arguments by voting against the officials who were responsible for the iniquitous law. At stated periods this attempt to fasten upon our cities one of the most immoral of French customs raises its head in various parts of the country. It obtained a foothold in St. Louis, until swept away by the indignation of decent citizens. It cropped out in New Orleans, and now it is coming to the surface in San Francisco, that hot bed of wickedness. It will never be tolerated by the wives and mothers of this country, and they can always depend upon the assistance of enough respectable men to insure its defeat. It must be remembered, however, that in every case, it has been men who have made and enforced this law, for the protection not of women but of men.

\* \* \*

The *North American Review* for May contains an article on "The New Woman" by "Ouida," the novelist, who seldom has a good word to say for her sex, and whose own reputation has suffered considerably in the wear and tear of life. She has an utter abhorrence for the "new woman;" equal suffrage is in her eye the worst form of immorality; a college education for women can only be hardening and deforming; public schools, hotels, railway trains and sea voyages are going to destroy all modesty in woman; and it will end by making her odious to man, and probably in her being kicked back roughly by him into the seclusion of the harem." If travel and education are to make our women as immodest as "Ouida's" ideal heroines, we might have occasion for alarm. The editor of the *Review* must find it difficult to get any one to take the negative side of this question, if he is obliged to put it into the hands of this notorious novel writer.

\* \* \*

The second annual convention of the national Federation of Woman's clubs was held in Philadelphia in May. It was attended by 700 delegates from 355 clubs in 36 different states. It was entertained at the New Century Club, one of the finest

club houses in the country. It was built and is owned and controlled exclusively by women. The Woman's club is a distinguishing feature of the present age, and there is scarcely a town of any size in the United States, that has not one or more of these organizations. Their objects are various, sometimes purely for literary culture, in many instances for reforms of different kinds, occasionally for political study, and also for the systematic study of art, of music and of household economics and the many subjects of interest that are occupying the great body of the women of to-day. They have operated, probably more than any one factor, in broadening the minds of women, teaching them that education does not stop when the school room door closes, arousing an interest in public affairs, and giving women confidence in their own powers. The club meetings are a pleasant social diversion in the somewhat monotonous life of women. This national federation, bringing them all together in one great organization, gives them additional strength and interest. The ideal club, the club of the future, will be composed of both men and women, in fact this plan has been adopted in a number of cities and found to be very acceptable. Of course there will be always some clubs exclusively for men and some exclusively for women, but experience is constantly demonstrating that everywhere the most satisfactory results are achieved where there is the concerted action of both men and women.

Coventry Patmore, an English writer, contributes to the current literature on "woman," which is occupying so large a space in the newspapers and magazines of the day. He thinks that woman's sole and only mission is to inspire man to do great things, and he says, "she is able to fulfill this, her necessary and delightful function, just because she, herself, is nothing in battle, policy, poetry, discovery, or original, intellectual or moral force of any kind." And so it is to this cipher that men must look for their inspiration to noble deeds? Well, thank Heaven, the little Coventry Patmores are growing beautifully less, and a race of men are coming, are here indeed, who not only recognize the moral and intellectual force of women but glory in it, and find therein their most powerful incentive to make of themselves all that this new order of womankind demands and expects.

# NOTES.

We acknowledge the receipt of resolutions of respect and a poem in memory of Mrs. L. H. Fitch, a member of Welcome Lodge, No. 9, Ladies' Society, B. of L. F., Needles, Cal. Our space is so limited that we are not able to publish these or any others of a similar nature, although we should like to give pleasure to the friends.

A poem received from Newton, Iowa, entitled "loved in Vain," possesses some interest, but we cannot use it. There is not one line which is written grammatically and correctly capitalized, spelled and punctuated. It would have to be entirely rewritten, and time is too valuable.

Woman's Dept.:—The May number, has considerable to say about woman suffrage I will say something also.

You say "The Protestant ministers of Colorado and the Catholic bishops and clergy gave strong support to the woman suffrage movement during the recent campaign in that state."

What a credit it must be to the cause to gain that victory in Colorado, where the dominant party breathes forth anarchism and socialism, and cries from behind the executive in his chair that the people should ride *blood to the bridle bits*.

What a victory you down trodden women have gained. Here in Massachusetts, where there are so many homes of culture and refinement where woman is the centre of attraction the bright and shining light wielding such moral and divine influence, and where institutions of learning and culture were established before Colorado was thought of. Strange that woman can't have suffrage.

In your article "The making of a woman," you and Mrs. M. Orrell seem to criticize and judge Mr. Bok wrongfully. Mr. Bok is right in his argument.

This is a sorry age for this country, that woman has become canonized. I honor woman, I respect woman, I sympathize with woman, I reverence woman, but it is the grand and Godly woman of the old school, and the refined and cultured lady educated by this Mamon loving generation to wrapp their hearts up in silks and tie them with ribbons and judge a man by the size of his pocket book. Look at all the flaming palaces of hell in the city presided over by women, talk about purifying the ballott!

What a relishing sight it is to see a young woman 21 or 22 marrying an old man of 60 for his millions, oh, yes, you tender women, you talk purity but when you prostitute yourselves to a rich man thats all right. In that article I have mentioned regarding Mr. Bok that woman who said she had an

offer of a young marriage, but she did not want it because she would have to deny herself of a great many things, that she could love the man if she wanted to. Let me tell you right here such as she is is what fills all our houses of prostitutes. When woman says, that when financial reverses come to a family love goes out of the back door, and by what I have seen it is about so, but only among you enlightened and cultured American women.

It is not good for man to be alone I will create for him a helpmeet.

This age of Christian enlightenment that calls her a companion for the rich man and a helpmeet for the poor man.

#### C. U. Again.

[Our correspondent seems somewhat confused in his ideas, but we cheerfully grant him a place in our free parliament. Such articles help the cause they attack. The reason the women of Massachusetts cannot get the suffrage is because the whiskey lobby in the legislature is too strong for them. We are glad to know from his own declaration, that our correspondent has so much respect for women. We should never know it from the general tone of his letter.—ED.]

#### "THE SONG OF THE SHOP!"

[There are shop girls in Islington working one hundred and seven hours a week.]

With eye-lids weary and worn,  
With limbs as heavy as lead,  
A shop-girl sat in her chill, bare room,  
Holding her aching head,  
And over her pale, thin face  
The tears were beginning to drop,  
As, checking a sigh that became a sob,  
She sang the "Song of the Shop!"

"O! its work—work—work!  
Till the brain begins to swim;  
And work—work—work!  
Till I ache in every limb;  
Compelled through the live-long day  
Behind the counter to stand,  
Till the heart grows sick and the brain be-  
numbed,  
As well as the weary hand.  
"Work—work—work!  
In the hurry and rush and glare;  
Work—work—work!  
In the foul, gas-poisoned air.  
Whatever the seasons be,  
No change in my lot they bring—  
And it's only because the fashions change  
That I know it once more is spring.  
"Oh! but to breathe once more  
The breath of the cowslip sweet;  
To see the blue sky above my head  
And green grass beneath my feet.  
Oh! but for one short hour  
To feel as I used to feel,  
Before to the counter I was bound.  
Like a slave, with chains of steel."

With eye-lids weary and worn,  
With limbs as heavy as lead,  
A shop-girl sat in her chill, bare room  
Holding her aching head,  
Essaying in vain to check  
The tears that perforce would drop  
As still, in a voice of dolorous tone  
That was half a sob and half a moan,  
She sang this "Song of the Shop!"

—London Truth.

#### Her Brother Entertained Him.

She was not quite ready to receive him, says the *New York Press*, so she sent her little brother to entertain him while she put the finishing touches to her toilet.

The entertainment was lively if not satisfactory.

"You are Ethel's beau, ain't you?" the youthful prospective brother-in-law began.

"Yes," said the youth, pleasantly.

"You have money in the bank, haven't you?"

"Yes."

"And it's in your own name, ain't it?"

"Yes."

"And you expect to keep it in your own name after you're married to Ethel?"

"Well—er—yes."

"Well Ethel will have something to say about that."

Ethel's beau began to feel uncomfortable. "You smoke, don't you?" continued the inquisitor.

"Yes, a little."

"And you expect to smoke after you are married to Ethel."

"Ye-es."

"Well, Ethel will have something to say about that?"

Ethel's beau felt more uncomfortable than ever.

"You belong to a club, don't you?" pursued the self-possessed urchin.

"Ye-es."

"And you expect to belong to it after you are married to Ethel?"

"I suppose so."

"Well, Ethel will have something to say about that."

Ethel's beau was growing red in the face.

"You play billiards, don't you?" continued the boy.

"Yes, sometimes."

"And you expect to play sometimes after you're married to Ethel?"

"I do."

"Well, Ethel will have something to say about that."

"Look here, my young friend," said the exasperated lover; "I've got an important engagement which I forgot. I'm going to attend to it. You tell Ethel I've gone, and see what she has to say about that."

And he went.

#### D.

He calls her his dearest, his darling,  
His dearie, his dove, for you see,  
More frequent than raindrops in April  
Are love terms beginning with D.

#### AFTERWARD.

The cooking is really quite dreadful,  
The baby is howling high C,  
And frequent as raindrops in April  
Are phrases beginning with D.

### CONDITIONS.

The optimist may be satisfied with conditions and the pessimist may lament over what he deems the misfortunes of mankind, and if the pessimist seeks to remedy the affliction, whatever it may be, he is the better man of the two, but if he is content to murmur, bewail and croak, then the optimist is the more lovable character. There are certain untoward conditions which, being productive of great mental or physical distress, cannot be contemplated with composure, so independent of human agency that they are termed "acts of God." It would be an easy task to catalogue some of them as, for instance, earthquakes, cyclones, the calamities attending overflows of rivers, death dealing thunderbolts, storms at sea, when navies go down, railroad wrecks which neither care nor foresight could prevent, and many other kindred and inscrutable dispensations. In such cases it were folly to complain. There is no remedy. The best that can be done is to consult experience and science for the purpose of reducing results in the line of death and destruction to the minimum. Men possessed of common sense do not, while contemplating disasters of the kind mentioned, sit down and growl on the one hand, content with the theory that all things are for the worst, nor, on the other hand, fold their hands and smilingly assert that things are ordered for the best. On the contrary, they take a hand in ordering and adjusting affairs to the extent, at least, of confronting nature with appliances designed to modify the disastrous consequences of conditions they

did not create, as, for instance, build strong ships to battle with storms at sea, set up lightning rods to catch thunderbolts, build low, one-story houses when living within a seismic territory, and thus we could indefinitely point out how men on the alert, in a measure, at least, may modify results when conditions productive of disaster are beyond their control.

But there are conditions brought about by human agencies, many of which are fruitful of calamities of wider sweep and more direful consequences than those which are credited to a mysterious providence. And it is such conditions that men are required to consider, because by giving them special examination ways and means may be found to change them and create other conditions calculated to promote the welfare of individuals and communities.

In this connection it becomes eminently prudent to inquire regarding the condition of our country. It is blessed beyond the power of hyperbole with food products. Our granaries are full to repletion, and we seek constantly for foreign markets in which to dispose of the surplus. In this we have a condition that even a pessimist must approve and admire, and an optimist may shout with some show of propriety, "I told you so; all things are done for the best." Certainly, it was the order of nature to create the soil, to send the sunshine and the rain, and it was the order of a largely redeemed human nature from savagery to plow, sow, cultivate and harvest the products. Usually, however, we credit such a condition to Providence, and to such a conclusion we are not disposed to offer objections further than to say, "in creating them, God and man are in alliance." But while we are indulging in thanksgiving for such boundless stores of food, we are confronted by a condition which silences rejoicings. Multiplied thousands of our people, men women and children, are in the grasp of hunger, premonition of famine. What of such a condition? It is purely a condition brought about by human agencies. There is no mysterious Providence in any sense responsible, and hence it becomes possible for human agencies to diminish the sufferings of the peo-

ple, and these are being employed; but to abate the distress caused by the conditions is not sufficient, the supreme demand being to prevent the recurrence of such national calamities.

In surveying the field of battle, for such it is, where the idle, the impoverished, the ragged, hungry and homeless, have struggled for life, men, stout-hearted and strong-nerved confess to sensations akin to despair. To relieve the universal distress, to provide for the destitution seen on every hand, appears a work so herculean that only the power of a miracle working God is equal to the task; but as the condition was created by man, man must work out of it or succumb to the indecipherable curse, and if experience—and since the new world was discovered it never taught a more terrible lesson for the benefit of workingmen—will not suffice to redeem men from the bondage of error when by the fiat of their sovereign will it may be done, then the time is at hand to write the epitaph of a government by the people, of the people and for the people.

Men who discuss remedies for conditions productive of disaster, inquire relative to the cause of the calamity. The President of the United States, after collecting all the facts available by the government, called congress in extraordinary session to change deplorable conditions. Banks were failing by the hundred, industrial enterprises were closing their doors, money became phenomenally scarce, disaster after disaster followed fast and followed faster, wreck and ruin was seen on all sides, and the president said the condition was owing to "congressional legislation." That was the cause assigned by the chief magistrate of the nation, and the legislation which was selected to bear the anathemas of the nation was the famous and infamous "Sherman bill," which simply provided for the purchase of a certain amount of silver bullion for which the government issued in payment silver certificates which entered into the currency of the country. It was charged that the "Sherman bill" caused undue exportation of gold, and with this the hue and cry began.

The arraignment of congress upon the

charge of being responsible for the calamities under which the country for a year past has suffered, is an indictment of the people, of popular government in all of its branches, since it is the theory of our government that the people are sovereign, and have such laws and such administration of the government as they desire. But this may be said, if the people find themselves betrayed by their representatives they may displace them for others who are not knaves, and in this way so far as legislature is concerned, change conditions or prevent the recurrence of calamitous conditions; but everything depends upon the intelligence, courage, and integrity of the people.

In discussing the deplorable condition of business affairs it will be profitable to keep prominently in mind President Cleveland's declaration that the cause is "congressional legislation." We do not doubt the president's averment, hence we affirm that congress has betrayed the people. The president's indictment includes the two great parties that have for years controlled congressional legislation, and these two great parties, corrupt to the core, are now asking the people to still further trust them. They closed the mills and the factories throughout the great mining regions; they closed the silver mines as if by a decree of Jehovah. They created a condition in finance which paralyzed business of every description and filled the land with idleness and all the indescribable woes which idleness inflicts, and now they appeal to the victims of their perfidy and treachery for a new lease of power, that congressional legislation may proceed in the old ruts, and in the old ruts it is proceeding. Bearing in mind the declaration of the president, charging present conditions upon congressional legislation, men naturally turn to congress for relief, and are required to contemplate spectacles of wrangling, duplicity and perfidy which leads to the conclusion that conditions are to be made still more disastrous. Senators are charged with using their information for successful gambling in stocks, and an investigation is to probe the charge to find the depths of congressional rottenness. The great body of the people have lost all confidence in congressional integrity. The

hope which animated the nation when congress assembled, that conditions would be changed for the better, has practically faded out of sight. Business demoralization continues. The army of men forced into idleness is not diminished; the fangs and pangs of hunger are doing their work; tramps multiply. Those who have work are confronted with demands for a reduction in wages; poverty goes down to deeper depths. There are more rags, more riots, but no reform, and still congress yields only dead sea fruit, and the conclusion is forced upon all thinking men that parties as they exist cannot create better conditions and will not supply remedies for the disasters which the president says are the result congressional legislation.

If the ballot is to change conditions, if the ballot is to prevent the recurrence of such conditions as now afflict the country, it is time that workingmen should renounce their bondage to the old parties, to find or found one whose representatives in congress shall so legislate that no president from this time forthwith and forever shall be required to say that the country is in the grasp of appalling calamities as the result of "congressional legislation." Will workingmen be taught by experience? Will they heed admonitions such as present conditions voice in thunder tones? We shall see.

It is officially stated that a mistake is made by those who think \$50,000 a year is all the President of the United States receives. In addition to that sum the chief magistrate is given \$33,034 to pay the salaries of his clerks and subordinates. His private secretary has \$3,250, his assistant secretary \$2,250, the stenographer gets \$1,800, each of five messengers \$1,200, the steward \$1,800, each of the two doorkeepers \$1,200, while other employees are paid in proportion, down to the man who takes care of the fires, who receives \$864. In addition \$8,000 is allowed for incidentals, such as stationery and carpets, \$12,500 for repairs and refurnishing, \$2,500 for fuel, \$4,000 for the greenhouse, and \$15,000 for the stable, gas and other incidentals. In all the president and his house cost the country over \$125,000.

#### REMINISCENT.

On the 16th day of July, 1880, by the exceeding kindness and confidence of friends, to memory dear, we were made editor of the *LOCOMOTIVE FIREMEN'S MAGAZINE*. That was fourteen years ago. We write reminiscently. We are turning the accomplishment of those fourteen years into an hour glass, and musingly note the sands, recalling all the hours they measure by their passage. We group into bright constellations old friends, good friends, dear friends, and as their light, the light of other days, beams down upon us, the song of our heart is,

And here's a hand, my trusty fere!

And gie's a hand o' thine!

And we'll tak' a right gude willie waught,

For auld lang syne,

For auld lang syne, my dear,

For auld lang syne,

We'll tak' a cup o' kindness yet,

For auld lang syne.

It has been written that "years steal fire from the mind as vigor from the limb." Possibly! later on, we shall doubtless be convinced of the declaration, not now; and yet, fourteen years of toil and anxiety have made many a man prematurely old, whitened his locks and wrinkled his brow, and made life a burden. It is the habit of some to "sigh for vanished years." We are not of the number. It may be, and it is doubtless true, that "there is a tide in the affairs of men, which, taken at the flood, leads on to fortune," and which if "omitted, all the voyage of their life is bound in shallows and miseries." We have great respect for the Bard of Avon, and are not disposed to venture a controversy with such august authority, but it may be said, taking a general survey of the "affairs of men," that a great majority fail to see the tide in time to take it and ride upon its crest to fortune.

At the early age of 24 years our attention was called to the tide which offered the editorship of the *FIREMEN'S MAGAZINE*. It was thought to be an auspicious tide, and we seized it with all the enthusiasm of youth. Did it "lead on to fortune?" Well, that depends specifically upon what the term fortune is made to signify. Lexicographers are prolific in definitions and some one of them ought to meet our editorial venture, but the indications are that of a list of about thirty not one exactly fits the

case. Our mounting of the tripod can scarcely be referred to as chance, accident, luck, hap or fortuity, since, in no instance, was the position accepted as a means of livelihood; a hundred openings to moderate ambition promised better returns, certainly no prospect of estate, substance, property and possessions, ever dazzled our eyes or tickled our fancy, and wealth, riches, opulence, never flashed above the horizon as stars in the firmament of hope to inspire us to do and dare for the purpose of gathering in bullion with the idea of becoming a millionaire, to dress in purple and fine linen, hire a French cook, and have strawberry shortcake every day. Aside from such considerations, the tide that took us into the editorial chair in the sanctum of the FIREMEN'S MAGAZINE, if not an incident presaging fortune, has at no time during our incumbency, been labelled a misfortune or unfortunate.

True enough, tides and winds have not always been fair, seas have not always been tranquil, but year after year, on the first day of January, we have launched a new volume, have made fourteen voyages, and on each succeeding December have returned to port with every mast, sail and rope intact, and ready to set sail again. And now, after fourteen voyages midst shine and storm, the good old ship, staunch and sound from keelson to quarter deck, is in better condition to contend with gale and billow than when first we took command.

We first joined the order February 27th, 1875.

When our name first appeared as editor the MAGAZINE had an enrolled subscription list of 1,800, all told. It has since reached a circulation of 35,000, a gain of nearly 2,000 per cent., an average of nearly 150 per cent. a year.

In felicitating the great Brotherhood of Locomotive Firemen upon the steady growth of its MAGAZINE it will not be regarded as vain boasting, if, in throwing a backward glance over the years of our editorial pilgrimage we, too, accept the felicitations of facts showing the phenomenal growth of the MAGAZINE.

THE FIREMEN'S MAGAZINE, since it passed under our control, contains the history of

the order in every essential particular. To write a history of the Brotherhood of Locomotive Firemen from the day of its organization to the present, the MAGAZINE would supply all needed data. It contains the public utterances of its grand officers when made from manuscript, as also the reports of its grand officers to annual and biennial conventions, so that step by step the evolution record of the brotherhood from small beginnings to its present numerical strength, wealth and influence, is preserved, and those who would know its advancement may find the interesting data in the pages of the MAGAZINE.

It would be the merest prudery on the part of the writer to intimate that real satisfaction is not experienced in the contemplation of his connection with the FIREMEN'S MAGAZINE. Assuming control of the publication, when, as has been stated, its monthly edition was only 1,800, pride and ambition, coupled with a desire to promote the welfare of the order, prompted ceaseless efforts to improve its various departments and give it commanding prominence in the list of the labor organs of the times. To say that this laudable ambition has been fully realized, is but to state a universal verdict from which there has been no appeal. We recall no question relating to the welfare of labor, that has been up for debate since we took charge of the MAGAZINE, that has not been discussed in its pages, and such was the prudence and opportuneness of its utterances that those who recognized their merits, included many of the best writers and thinkers of the period.

It would be remarkable, indeed, if during fourteen years no mistakes had been made, and it is quite as noticeable that the list of errors, all things considered, is so limited. The maxim here applies that "it is human to err, and divine to forgive," and thus, as we write, to the extent of our ability, mistakes are obliterated, and only the words fitly spoken, which are like "apples of gold in pictures of silver," are to have a place upon the tablets of memory.

We write in a reminiscent vein, because the 16th of July is an anniversary day, recalling the beginning of our editorial career—a valedictory may appear later, when we

say farewell and leave to other hands the work we have pursued since July 16th, 1880.

### THE COAL MINERS' STRIKE.

All things considered the strike of the coal miners of the United States is probably the most serious event in industrial affairs that ever occurred in this country.

In the onward march of invention steam power is employed almost universally; coal has practically displaced wood as fuel, and as a result, wherever a locomotive puffs and whistles on the 200,000 miles of the railroads of the country, or wherever a stationary engine is located, coal is in demand as a fuel. Nor is this all. Beyond the limits of natural gas, in all the great cities and most important towns, coal is used for domestic purposes, and thus coal becomes a universal fuel—an article of prime necessity, the importance of which cannot be exaggerated.

A person at all thoughtful need only to survey the field of enterprises in which coal is used to generate steam, to be convinced that to cut off the supply of coal, or to materially reduce the quantity mined, must be attended with incalculable disasters to business; disasters so overwhelming in their sweep as to arrest the wheels of progress and the march of civilization.

According to the census report there was mined in the United States in 1889, 65,723,110 tons of bituminous coal, and 35,863,230 tons of anthracite coal—a total of 101,586,360 tons, and it is safe to say that now the annual product of the mines is not less than 150,000,000 tons, and to say there are 300,000 men employed in mining this annual output is an exceedingly conservative estimate.

In this brief outline it is seen that in itself the coal mining industry expands to vast proportions, and when we consider how intimately and indissolubly coal is associated with all the great industrial enterprises of the country, the mining industry expands to such proportions of interest and importance that it is practically impossible to grasp sums total.

If we were to introduce arguments relating to cause and effect, we are inclined to the opinion that no other industry in this

country is productive of an amount of wealth approximating that which can be traced directly to the labors of the coal miner; and the inquiry is naturally suggested, Does the miner, even in a remote degree, share in the benefits which his arduous vocation creates? That he does not is universally conceded.

If the investigator goes to the anthracite coal fields of Pennsylvania for facts and proof, he will be forced to the conclusion that in no land beneath the sun, in no era of the world's history, has human depravity had a more satanic exemplification than in the afflictions which the proprietors of the Pennsylvania anthracite coal mines have studiously and continuously visited upon coal miners; and coal proprietors everywhere throughout the country, with exceptions as rare as angels' visits, have pursued the same degrading, defrauding, hunger-panged policy. The world has known the enormity of the evils complained of. The story in all its haggard features has repeatedly been told. The miserable victims of "man's inhumanity to man" have occasionally rebelled, only to be forced into submission by hunger, cold and nakedness. Living but one remove from the condition of wild beasts, they lived and toiled and died, the victims of cruelty, poverty and degradation such as have cursed no civilized land under heaven.

But, and America ought to be thankful for the fact, coal miners had not become so debased that they would no longer protest, and under the leadership of men who knew the right and dared maintain it, the miners organized to demand justice, and all ordinary efforts having failed to secure redress, at least 150,000 men resolved to cease digging coal until they secured fair wages for their work. This organization is known as the United Mine Workers.

The cause of the strike now in full blast was the reduction of wages in certain districts, where the prevailing price at the beginning of the reduction was 79 cents a ton and the cut proceeded until prices were reduced all the way from 38 to 60 cents a ton, netting a man from 50 to 75 cents a day.

The resistance to this piratical policy began by local strikes, but no benefit resulted,

and there came the order for the members of the United Mine Workers to quit; and as we write not less than 150,000 men are idle, demanding 70 cents a ton as a uniform rate for digging a ton of coal; and no man who is at all familiar with the subject will charge the miners with making an unreasonable demand.

We have indicated the great importance of coal as a fuel, and this fact has prompted proprietors to put forth superhuman efforts to replace the miners who are striking, by men who, regardless of right and justice, are willing to accept such wages as the proprietors offer. The regular miners, who are contending for simple justice, are disposed to resist the employment of such men, and as we write news comes of battle and blood—of dead and wounded, and the outlook is full of peril.

Already the premonitions of a coal famine are widespread and unmistakable. In numerous instances railroads have felt its grasp and have reduced the number of their trains. From every direction information comes that factories have had to suspend operations, and the declaration is made that unless the miners at an early day resume work, the condition of business will be of a character so deplorable as to defy exaggeration. Every branch of business will, to a greater or less extent, be involved. Ten thousand engines will stand still, and a million employes will be added to the ranks of the idle—and all because 150,000 or 200,000 miners absolutely declare they are robbed, degraded and starved that mine owners may grow rich upon their unrequited toil.

What is to be done?

It is the old, old question. If the miners can hold out the operators will be compelled to pay them fair wages; and since the alternatives are work and starve, or be idle and take the chances, the indications are that the latter choice will be made, and if it is, the duration of the struggle cannot, in the nature of things, be long protracted, and the miners will win a notable victory, all the more certain because their demands are just.

We predict a victory for the Mine Workers. In saying this we are not unmindful

of the sacrifices the mine workers are making, but we believe the interests at stake demand that the struggle shall be carried forward until the nation shall learn also, by sacrifice, the fact hitherto disregarded, that the nation's boasted wealth and progress, civilization and all its attendant blessings, depend primarily upon the toiling masses, and that justice to them, whether resulting from legislation, arbitration or striking, is the basis of national prosperity. Experience may be, and often is, a dear school, but if the nation will learn in no other school, then, let the test come, as come it will, and the sooner it comes the better it will be for all concerned.

#### WEALTH AND LABOR.

We have on our table two bulletins of the U. S. census bureau for 1890. One, treating of the wealth of the United States and giving totals for four decades from 1850 to 1890, and the other, treating of the industries of the country, show the increase in the number of establishments, capital, employes, etc., for the decade between 1880 and 1890, the figures of both bulletins showing a marvelous increase of wealth, industrial enterprises, capital, product, etc.

Referring to the bulletin showing the wealth of the country, the figures are as follows:

TRUE VALUATION OF ALL REAL AND PERSONAL PROPERTY.

Year.	AMOUNT.	PER CAPITA.	INCREASE PER CENT.
1850	\$7,135,780,228	\$308	
1860	16,159,616,068	514	126.46
1870	30,068,518,507	780	85.07
1880	43,642,000,000	870	45.14
1890	65,037,091,197	1,039	49.02

ASSESSED VALUATION OF REAL AND PERSONAL PROPERTY.

Year.	TOTAL.	PER CAPITA.	INCREASE PER CENT.
1850	\$6,024,696,900	\$260	
1860	12,084,560,005	384	100.58
1870	14,178,986,732	368	17.33
1880	17,139,903,495	342	20.88
1890	25,473,173,418	407	48.62

The foregoing table discloses some things of special interest, as for instance, in 1850, 84.2 per cent. of the "true valuation" of the wealth of the country was assessed for taxation. In 1860 only 74.7 per cent. was as-

assessed for taxation, in 1870 the amount assessed had fallen to 47.2 per cent.; in 1880, it declined to 39.5 per cent. and in 1890, the assessed value of the wealth of the country was only 40 per cent. of its true value, or in other words, in 1890, \$39,654,917,779 of the wealth of the country escaped taxation.

But our purpose in giving the census figures of the nation's wealth is to enable the readers to see at a glance the growth of the nation's wealth, demonstrating that we are the richest nation on the planet. This increase from 1850 to 1890, forty years, amounts to the colossal sum of \$57,901,310,969, or an average of \$1,447,532,774 a year, for forty years. It is just here that the political economy declaration comes prominently into view, that all wealth is created by labor, hence, without labor no wealth is created.

Dismissing this branch of the subject for the present, we turn to the industries of the United States as tabulated by the census bureau. Here again we find food for profound reflection upon the proposition that labor not only creates all the wealth, but is the chief factor in all that goes to achieve progress, maintain the government and give character to our civilization.

The census bureau supplies the data for 67 of the leading industries of the country, which constitute 80.89 per cent. of all the industrial establishments, and shows what the increase has been in the number of establishments, the capital invested, number of employees, amount paid out for labor, the cost of materials and the value of the product for the years 1880 and 1890, as follows:

1890, number of establishments . . .	296,133
1880, number of establishments . . .	222,937

Increase . . . . .	105,440
1890, capital invested . . .	\$5,282,950,531
1880, capital invested . . .	2,274,382,070

Increase . . . . .	\$3,008,568,461
1890, number of employees . . .	3,775,602
1880, number of employees . . .	2,155,022

Increase . . . . .	1,620,579
1890, paid for wages . . . . .	\$1,839,017,529
1880, paid for wages . . . . .	747,610,056

Increase . . . . .	\$1,091,407,473
--------------------	-----------------

1890, cost of material . . . . .	\$4,249,091,779
1880, cost of material . . . . .	2,274,382,070

Increase . . . . .	\$1,974,709,709
1890, value of product . . . . .	\$9,987,641,779
1880, value of product . . . . .	4,335,207,779

Increase . . . . .	\$3,152,434,000
--------------------	-----------------

In the foregoing we have 80.89 per cent. of all the establishments in the country, 80.45 per cent. of all the capital invested, 79.17 per cent. of all the employees, 79.24 per cent. of the wages for all industries, 80.89 per cent. of total materials for all industries and 81.31 per cent. of the total product of all manufacturers of the country. By this statement we find that the total number of industrial establishments in the country in 1890, was 368,063. The capital invested in all industries in 1890 amounted to \$6,500,750,181. The number of employees in all the establishments in 1890 was 4,769,000. The total amount paid out for wages in 1890 was \$2,305,289,301. The cost of the material for all industries in 1890 was \$5,127,959,629, and the total product of all the industrial establishments in 1890 was \$9,454,918,620. It is seen by the figures introduced, that in 1890, the product of all of the industries of the country reached the colossal sum total of \$9,454,918,620. The cost of materials was \$5,127,954,629, leaving \$4,327,304,001. Out of this the sum labor received in wages was \$2,305,289,301, leaving \$2,022,074,708 as profit to owners, an amount which paid them 30.7 per cent. on their investment, while the average yearly income of the employees was \$482, or for 300 days, an average of \$1.60 per day. It is seen that while the employees received \$482 for a year's work, the 368,063 establishments received an average of \$5.30 each. Had the proprietors been content with, say, 10 per cent., instead of 30.7 per cent. of the profits, the employee would have received a large share of the wealth they had created.

The figures we have introduced show that for the year 1890, 4,769,000 employees produced wares valued at \$9,454,918,620, or an average of \$1,982, of which he received \$482, leaving \$1,500 for his employer. With such facts in full view, it is easy to account for the rapid multiplication of millionaires in the country and for the increasing poverty of

the toiling masses. In view of figures submitted, no reflecting mind can contemplate the sum total of which labor creates, without being profoundly impressed with the fact that the efforts which are made to degrade labor are a crime against humanity, a crime; which sooner or later will call down the vengeance of heaven; a crime that will imperil the government and its institutions, arrest the march of progress and blotch our civilization. And no fact which now challenges the attention of men, in all the walks of life, is more conspicuous, or fraught with more danger to the peace and prosperity of the nation, than the ceaseless efforts of employers to reduce wages, and thereby weld upon the limbs of labor the fetters of poverty more securely. To resist this enslavement labor organizes; but since only a majority of the toilers are organized, the degradation of labor proceeds, and if at any time it becomes apparent that labor is cheered by the prospect of victories, court injunctions, deputy marshals armed with Winchester rifles, authorized to kill in the name of the law, turn victories into defeat, or if these fail, armed soldiers are called out and the state aids in the degradation of workingmen.

We have shown by the highest authority, that in 1890 there were 4,769,000 employees in the various manufacturing industries of the country. If to this number there is added the employees in mines and engaged in transportation, the number would expand to 6,000,000. Of this vast army, how many are organized in all of the brotherhoods of the land, possibly 1,000,000 or 1,500,000, and as a general proposition these organized men have demonstrated their impotency to resist the downward course of wages, and the result constitutes, today, and object lesson of terrible significance. Present conditions ought, in the very nature of things, to solidify the workingmen of America. If it is not done, the perils of poverty will materialize—indeed the word is already going forward and the end is likely to be disasters that even brave men do not care to contemplate.

"THE flag of the free heart's only home, by angel hands to valor given," *alias* "Old Glory," was devised as early as 1777.

### JUDGE JENKINS.

There is, after all, say what we will, something in a name. Ordinarily, men make little note of names, but occasionally the fact confronts us that a name, considered in connection with other things with which it is associated, is singularly incongruous—its inappropriateness is seen at a glance, and the mind yields assent to the absurdity in spite of itself. If an effort is made to reverse the verdict the unsuitableness of the name is only the more stubbornly asserted, and no divinity, however industriously it may hew and whittle, can change our conviction. Jenkins is a case in point. Jenkins as a clown, a buffoon, a jack-pudding, a zany, any sort of a mountebank, would pass unnoticed. Jenkins as a dancing master or a floor-walker in some fashionable notion store, would be well enough, but Jenkins, as a United States Judge, is where the name forces the conclusion that a serious incompatibility exists. Jenkins has long been a man that suggests the dude, the masher, a person of small head, small capacities, who parts his hair in the middle, and smells of pomatum, wears corsets, and who is never more happy than when in a swallow tail coat and shining tile he is the laughing stock of level headed men and women—and nothing is more common than to refer to such a coxcomb, as a "Jenkins"—a "Jenkins of a fellow," an exquisite "jackanapes, of no particular consequence in this or any other world. It is seen at a glance that when Jenkins was made a United States Judge, people had a right to expect that a reign of damphoolism on the bench would be inaugurated the moment an opportunity offered for a display of first-class asininity. The opportunity came, and Jenkins was ready. Jenkins became a tool of the corporation—a highly serviceable tool. Donning cap and bells the corporation could use him as a gimlet, pod auger, monkey wrench, jack-screw, drill, crow bar, anything conditions might require. In fact, the corporation used him as a bomb, and Jenkins exploded several times, and the corporation chuckled and exclaimed—"How's that for high Jenks?" During these performances, Jenkins, covered all over with ermine, danced around in the

ring while the corporation shouted "Bravo!" "Good for you, Jenks!" Jenkins accepted this flatulent flattery and expanded to prodigious proportions, soliloquizing, "I am the long looked for Daniel come to judgment, the one Jenkins of all the Jenkinsees—since Adam was a rag baby and mosquitoes wore boots, the world has sighed for. I can twist the tail of the lion of labor until its squeal can be heard from the Mississippi to the Pacific, and corporations will be induced to build a monument to perpetuate the name of the *only* Jenkins that ever appeared on this mundane sphere, since the first Jenkins tadpole lost its tail." Manifestly, Jenkins was as happy as a clam at high tide. He had won the applause of the corporations, and corporations have money and give dinners. They can "touch the button" and all the trains on the continent are at the service of those who do their bidding. What cared Jenkins for the hireling employes? They could not banquet him, give him free passes, nor slip a thousand dollar greenback into his pocket "unbeknown" to him—and Jenkins, as wise as any other monkey, knows where his bread is buttered.

The trouble with Jenkins is and was, that like a small calibred imitation of a judge he got uproarously happy over an opportunity to perform an exceedingly dirty job in the interest of a corporation, regardless of decency, propriety and justice, and this he did with such lickspittle, fawning, debased subservency to the corporation and with such total disregard of the rights of employes, that he aroused universal indignation and contempt. Jenkins seems to have contemplated the performances of Ricks and Taft as below the standard corporations required to teach employes their dependence upon them for existence, and he decided to supply the long felt want. If he could not out Herod Herod, he felt confident he could out polecat Ricks and Taft and create a continental stink of forty horse power, and he did, be it said, perform that sort of a feat. Jenkins became notorious. No other Jenkins the world had known stood so much in need of disinfectants. His case was diagnosed by numerous horse doctors. It was given out that he

had blind staggers. Others thought corporation oats had produced pole-evil, or big-head—which seemed to be conceded and congress concluded to examine his case and pass sentence. Jenkins regarded the affair as in the highest degree complimentary and his head took to swelling still worse.

The congressional committee which investigated Jenkins, referring to his injunction, which provided that the employes of the Northern Pacific could not quit nor consider the propriety of striking without being guilty of contempt of court, says:

This was the object sought to be obtained. That the order was drawn to effect it, and it was signed by the Judge with that intent, the language of the order and concomitant circumstances left no room for doubt. Your committee has no hesitation in declaring that the orders rendered were a gross abuse of the power of the court, were supported by neither reason nor authority, were beyond the jurisdiction of the Judge and were therefore void.

Such is the opinion of a congressional committee sitting in judgment on Jenkins, pronouncing his orders as totally vicious and void, as a "gross abuse" of power, "supported by neither reason nor authority."

The committee further declared that "they clearly recognize the right of the laboring people, as a means of selling their labor at a higher price, of coercing employers to accede to their demands." • • • "The conclusion," therefore, of the Judge "that the employes of the Northern Pacific Railroad Company might be forced by him by writs of injunction to protect that company from loss and the public from inconvenience by remaining in its service at a rate of wages to which they had not given their assent, is one in which we can not concur, and which in our judgment is supported by none of the decisions which he cites." In this it is seen that the proper Jenkins placed under his orders to support them are all knocked out, and Jenkins, instead of being seated on a bench, finds himself soiling his judicial trousers by sitting in the dirt. The committee, however, finally came to Jenkins' rescue, lifted him up, put his hat on, brushed some of the dirt from his robes and said:

"Your committee find nothing in the testimony nor see any corrupt intention on the part of the Judge to render these orders. It is altogether possible that he is sincere in the conviction that he properly exercised the equity jurisdiction of his court in

preventing loss and damages which would have resulted from a lawful strike against the Northern Pacific Railroad Company. This view of the case prevents us from recommending any proceedings looking to his impeachment, but in order that there may be no further excuse for the rendition of any such orders or decrees and that the courts of equity of the United States may not be deceived as to the extent of their powers in enforcing contracts for personal services by legal process, we recommend the enactment of a statute which will prevent them from doing so.

Here we have a Judge, pronounced guilty of issuing orders embodying "gross abuse" of the power of the court, supported by neither reason nor authority, declaring it "altogether possible" that Jenkins was sincere in the conviction that he properly exercised the equity of jurisdiction of his court." If the committee is correct, then Jenkins must be either an ass or a knave, and from such a conclusion there is no escape for him, except to change the verdict and pronounce him both an ass and a knave. —Vale, Jenkins.

#### JOHN JACOB ASTOR.

The city of New York after the lapse of a century or more has a John Jacob Astor, a great grandson of the first John Jacob Astor, who laid the foundation of the Astor estate and fortune.

The present John Jacob is a "literary fellow," and has written a novel, "A Journey to Other Worlds." The author is a gentleman of thirty years, and the richest landlord in America, owns more "unearned increment" than any other man on the continent; just how much that amounts to no one is permitted to know, outside of the Astor family, and it is questionable if Mr. Astor himself could tell. The first Astor had the gift of foresight abnormally developed. He believed in acquiring land, and having secured a title to it, it was henceforth to be a part of the Astor estate, and to this day the Astors buy but never sell land; hence the present John Jacob is the largest landlord in America. The Astors are not bankers, they do not loan money, they engage in none of the business activities of this wonderfully active age. They simply rent property and collect rents, and as their cash accumulates they buy more land. The founder of the family saw big money in pelts, skins with the hair and fur

on them. Skinning fur bearing animals was his mission and he performed it magnificently. He found fortunes in fur, and having skinned everything from a mole to a bear to be found from the Hudson to the lakes, he branched out and extended his operations to the Pacific ocean. With the money thus obtained he bought land in and around the city of New York. His great grandson, John Jacob, has gone into the literary business, and his first effort is a book to bear the title of "A Journey to Other Worlds," purely a creation of the fancy. Mr. Astor projects himself into the year 2000 and begins his novel by describing the then city of New York, and then the world in general. In this he is not the first in explorations, several have preceded him, but John Jacob has made some discoveries that escaped the notice of the other dreamers, as for instance he discovered that departed spirits all go to the planet Saturn. John Jacob says he knows of no reason why departed spirits should not find a permanent home on some one of the planets, and therefore selects Saturn, one of the most interesting planets known to the solar system. Astronomers say that Saturn when nearest the earth is 811,000,000 miles distant, and how long it would take a departed spirit to reach Saturn, John Jacob does not say, but the surface area of Saturn being 19,600,000,000 square miles, which at 280 to the square mile, would accommodate 5,448,000,000,000 people, is probably why John Jacob selects Saturn for departed spirits. We do not doubt that John Jacob has studied carefully the Saturn land question, and very likely has picked out a locality for the Astor family. Being a churchman, John Jacob referred that part of his book locating departed spirits in Saturn, to Dr. Vibbert, of Trinity Chapel, who indorsed the theory, to the extent that it was not heterodox, and might be put forth as a harmless fancy. John Jacob has also studied science in relation to the triumphs of electricity. In the year 2000 John Jacob believes that electricity will do the work of the world, when men and women will cease to toil and all will become "commonwealers." As John Jacob will be in Saturn long before A. D. 2000, he does not inti-

mate whether the Astors will collect their rents by electricity or adhere to present methods. John Jacob puts forth the idea that in A. D. 2000 a new power will be in operation, which he calls "apergy," the reverse of gravitation, by which men will be able to rise from the earth and navigate the air. This done, good bye to all the transportation vehicles known to the present, a warning to the Vanderbilts and other railroad magnates to get ready for the appointment of receivers. John Jacob does not discuss social, political, or economic problems scientifically or otherwise, deeming it prudent to steer clear of the rocks and reefs upon which so many have been wrecked. The Saturn theory no one will antagonize, and the suggestion that men will be able to fly, though possibly a wild goose notion, will be popular with the masses. When a man with a hundred millions writes a book, he can give it a superb binding, at least, and if people won't buy it, he can give it away, and by advancing rents, say 5 per cent., get his money back.

We find going the rounds of the press the following bit of romance:

We are living, we are dwelling  
In a grand and awful time;  
In an age on ages telling,  
To be living is sublime.  
Hark! the waking up of nations,  
Gog and Magog to the fray!  
Hark! what soundeth? tis creation  
Groaning for its latter day!

What about the "grand and awful time" in which we are "living" and "dwelling?" What is there about the time imposing and solemn or direful and appalling? Why is it particularly exalted, stately and majestic "to be living" these days? It is a time when gilded thieves and freebooters have things pretty much their own way. It is a time of moral, religious, financial and political rottenness; a time for the organization, under the laws, of deadfalls to catch the unwary; a time when many divinely commissioned ambassadors (?) of the lowly Nazarene receive more cash for one sermon than the Master ever possessed during his incarnation, and whose sumptuous style says more distinctly than words, "I am your Shepherd and ye are my mutton." It is a "grand time" for watering stocks

and for collecting bucket-shop dividends, and an "awful time" for the poor devils who have to pay out of earnings that barely suffice to keep souls imprisoned in bodies that are mere prison houses. Scoundrelism in all its various phases was never more sublime than just in this time. The nations may be waking up, but if their eyes are yet half open, what evidence is there of such arousing? As for "Gog and Magog," does it matter which whips? As we view the subject Dog and Hog have formed an alliance with Bull and Bear, and in the "fray" are getting about everything in sight. They generally win and as their motto is, "To the victors belong the spoils," little is left for outsiders.

REPORTS have it that the Philadelphia & Reading R. R. has caught 12 men who stole rides on its trains, and has succeeded in having them sent to jail for 20 days. Suppose the stolen ride was worth \$1.25, then in that case the thieves are sweating out their fare in jail at the rate of 5 cents a day. During the past twenty-five years, gangs of burglars, probably not more than twelve in all, have stolen from the P. & R. not less than \$50,000,000. Had they been promptly arrested and imprisoned one day for each 5 cents stolen, or 60 cents a day for the entire gang, they would be entitled to their liberty A. D. 6560.

THE burning of the Talmage tabernacle on the 12th of last month was not an unmixed calamity. The concern was in debt and heavily insured. Inasmuch as it paid its labor and material men off at 23 cents on the dollar, the insurance based on full value will pay it out and enable them to rebuild. If lucky enough to again pay off the men who rebuild at 23 cents, they can burn it up again and make money. St. Paul's text, "Be ye diligent in business," is where DeWitt's lambs have anchored. Profits on church building pays the cost of inculcating the truths of the bible and slippery financeering.

THE startling headline in an exchange. "The Senate Has Waked Up," proves to have been a canard. The senate may die but never awakens.

**SARGENT AND HANNAHAN.**

It affords the MAGAZINE special pleasure to call the attention of its readers to the probability that Grand Master F. P. Sargent and Vice Grand Master J. J. Hannahan, of the Brotherhood of Locomotive Firemen, will be nominated as candidates for congressional honors.

They are confessedly representative men in labor organizations. Bro. Sargent is a man of clear perceptions, one who is eminently conservative, firm in his convictions, and logical in his conclusions. In congress he would be found a valuable member of committees, where thorough investigation is required. Bro. Hannahan, in congress, would at once take high rank on the floor as a speaker. He is a natural born orator. He has a brilliant imagination, and the rostrum has few more effective speakers than Bro. Hannahan. Should these gentlemen, members of our brotherhood, be elected, labor would have two champions of its cause, who would at all times be found reliable and incorruptible, no matter what the opportunities might be in that direction.

**The Old and the New.**

Wm. D. Crane and fanatics few, so few.  
Avarice, conceit and ignorance your hoodo, hoodo;  
Were the B. of L. F. controlled by such as you, I would  
say adieu.  
And live, die and go to heaven with the A. R. U.

Now through a sensitiveness pertaining to the laws of etiquette, it becomes my duty to offer to the many readers of the MAGAZINE an apology (which is justly due from my honored opponents) for the certain few who are debating the *merits* and *demerits* of the "new" and "old" dispensations, in view of the fact that we are monopolizing valuable space, and though our discussions evolve from a question of *universal welfare* and importance, I readily perceive and admit that they are not of public or national interest. In the first place Bro. W. S. Carter is solely responsible, as he propounded the "question," and those secondly responsible are such hammer heads as W. D. Crane and others of the leather eye nationality.

Bros. A. W. Dawler, Jno. A. Martin, Jas. Deegan and myself are registered upon the *affirmative* of the "question" advanced in the January number of the MAGAZINE by Bro. W. S. Carter, "Are the Brotherhoods a Failure?" and being to a great degree on the affirmative of the question, we are indisputably entitled to the closing argument. Now, Bro. Carter prepared his challenge for the autumn publications, but Bro. Debs was desirous of peace and unity in labor organizations and refused publication of any communication either for or against the A. R. U. In the meantime Bro. Carter appealed to the entire staff of B. of L. F.

grand officers and finally Bro. Debs sanctioned the publication of his sentiments, which fired the *first volley* in the battle that is now raging between "class organization" and the A. R. U. During the time that Bro. Carter was appealing to the grand lodge staff for the enforcement of his desires, Bro. Debs was daily rejecting or contributing to the waste basket numerous brilliant, fluent and patriotic essays pertaining to the mission, merits and principles of the A. R. U. If I remember correctly, the first appearance of the callow abbreviation (A. R. U.) in our MAGAZINE was in Bro. Carter's essay.

In reference to Bro. Crane's article, I must confess that I am astounded beyond comprehension that he has for once in his indolent career placed himself on record as being in cognition of the B. of L. F. But I am also pleased with his initial declaration of being an inhabitant of this uncelestial hemisphere, in the manner which he "advertises" Bro. Jno. A. Martin, of No. 328. I am aware that his love for Bro. Martin is by no means copious, owing to the fact that Bro. Martin has been a respective successor in lodge duties, which were at one time entrusted to the abilities of W. D. C., the incompetent, the irresolute and artful evader of lodge duties. The comparison of Bros. Crane and Martin is like that of "Emerson" and "Solomon," one is a dwarf, both physically and mentally, the other is a symmetrical giant, in both mind and body, and is a fair representative of the broad-minded, generous-hearted, patriotic and progressive class of men who help to mold the destinies and salvation of the professional railroad man. Bro. Crane states that "he helped to make B. of L. F. men of Bro. Martin and myself," this is a misstatement, as we were born *union label men*, but I think he was present at our initiation and he has since that time attended lodge as many as three or four times and yet complains of "growing gray" in replacing the "rotten" timbers in the bridge that has been worn out by drones and dead-heads. I say we need to overhaul the entire structure, as the abutments and piers are weak and the channel of the profession has been growing larger and cutting at both ends. Hence, the demand of the times is a larger, more modern and substantial "bridge." (Debs is building it.)

Brother Crane was firing an engine the day Brother Martin and myself were born; at the present is so engaged and does not stand far ahead of us on the "seniority" list either, so I here and forthwith submit the question of *progress* and *protection* and ask if existing circumstances are just and proper? No they are not! Yet, this is a fair illustration of what the *dear class organizations* have done for their mortal victims.

Then, as to "the office bee buzzing in my hat" Brother Crane, have no unnecessary fears, but just keep your eye on Brother Carter this September at the Harrisburg convention, and if he becomes editor of the *MAGAZINE* you will then have an unlimited space allotted you in order to do the necessary repairs on your "Bridge." As to your question, "Choice of traveling cards" I will ask if we do not, as individuals, bear and make valid the *recognition* of traveling cards?

I always have recognized cards and will continue to do so, but I have yet to garnish my first extra fireman for five dollars room rent. Now Bro. Crane I have known brotherhood men to do this very trick and yet, they were too *liberal* and *blest* of *brotherly love*, to join the A. R. U. May God grant their request, and protect the just!

And as to me "Knowing what it is to want a meal" that is correct. I claim that any man who ever asked for a situation at manual labor has, *indirectly* if not *directly*, asked for food.

While I have the floor I would call the kind and considerate attention of *all* readers, to an editorial on page 396 of the May number of the *Trainmen's Journal*. It is a slanderous composition, originated through avarice and ill will. It is a fair exposure of the terms governing certain popular class organizations, and such selfish, one sided views are the sole progenitors of the present (A. R. U.) reform.

One pitiful plea is, "Men make up all organizations and they can do no more in one than the other." Can it be possible that the author and his constituents are unaware that such past conditions inspired the first call for the "*New Bridge*?"

We have been in many instances, deprived of displaying our abilities for the betterment of our condition and utterly prevented from doing the "*good*" men *should* and *would* cheerfully do, only for being duped by that chestnut of a phrase "Honor the *grand chiefs* and our *dear* (yes indeed) brotherhoods." This plea alone lost the C., B. & Q. strike. Another gross insult is this: "Now what more can the A. R. U. accomplish than other organizations?" It can and has gained more newspaper notoriety it is true, but men can do as much practical good and more in the present organizations when they choose to work together and if they won't work together in their several organizations they won't come together anywhere else." I for one, prefer "cheap newspaper notoriety" to those "*dear*" grand lodge greetings for assessments number so and so of \$4.00." If all the brotherhoods would consolidate, dispensing thereby with numerous and expensive conventions and grand chiefs, and voice and forward the

principles of our salvation (the A. R. U.) then with the money so invested heretofore, the railway employees could control a few of those so termed "notoriety newspapers" and divide them so that corporations could not control every galley of type in the world! —? —? —? The editor also charges Bros. James Hogan and R. M. Goodwin with declaring the strike without the sanction of the employees or the superior authorities of the union. That is false, as the strike was ordered by a four-fifths majority of the employees.

Again, there are the grand officers who exerted their influence to defeat the G. N. and N. P. employees in their struggle for life, liberty and justice.

Here is an extract from the Associated Press of April the 16th, (three days after the strike):

CHIEF ARTHUR—HE'S GOING TO ST. PAUL TO INVESTIGATE THE STRIKE.

CHICAGO, April 16.—Chief P. M. Arthur, of the Brotherhood of Locomotive Engineers, and Chief Sargent, of the Firemen's order, passed through Chicago, to day, the former en route to St. Paul.

"I am going to St. Paul to investigate the Great Northern strike," said Chief Arthur. "When I was up there some weeks ago, the engineers entered a contract with the company, which was a settlement of their differences with the company. The strike, in so far as the engineers are engaged in it, is a violation of that agreement and a violation of the laws of the Engineers' brotherhood."

"Some of the engineers have struck, but whether the ones who have gone out are members of the brotherhood or not I do not know. If they are, they have violated the rules and must take the consequences."

"My object in going to St. Paul is to meet the executive committee of the engineers, the chairman of which telegraphed for me yesterday."

"Will you order the engineers, who are on strike to return to work if they are members of the brotherhood?" Mr. Arthur was asked.

"I cannot say as to that. Even if they should return to work that would not save them from the consequences of violating the rules of the brotherhood."

Bro. Crane may interrogate me for not writing directly to the *Trainmen's Journal*, but my reason for not doing so, is because I have sufficient reason to doubt the integrity of the presiding officers.

Bro. Debs fathered the B. of R. R. R. He it was who convinced the Brakemen that it was necessary that they be organized and for years B. of R. R. B. Lodge No. 1, bore the name E. V. Debs. So when the *Journal* betrays a *parent*, why should a stranger place confidence in it? Bro. Crane as to our "patent medicine advertisements" I will ask you or any other "fanatic" how great a per cent. of the *MAGAZINE* do you individually own? Now I am firing a run opposite you, how then can I attend the B. of L. F. on Tuesday, help to enact and advance the interests of the craft and then on Wednesday attend the A. R. U. and work to our detriment? I would be a fool, were I to tear down on Wednesday what I had assisted in formulating on Tuesday, would

I not? You should kindly thank any brother fireman who attends the A. R. U. in order that the firemen's interests be protected.

Now, Bro. Crane, you are sore against the MAGAZINE being used to build up the A. R. U.; well, I am *opposed* to its being used by Bro. Carter, yourself, or any one else, to tear down the A. R. U. Hence the discussion. "The *Railway Times*, the organ of the Union," that signifies all, firemen and all classes shall have a voice, in its pages, it does not *confine* its columns to *class or personal aggrandizement*! So the course pursued by the *Railway Times* *condemns and proves* your argument (the policy has been in vogue from the origin of class organizations) to be the *real and just* cause of the *death* of class organizations in railway service.

I recognize the fact that further discussion upon this question is unnecessary, from the fact that the greatest debaters the world has ever known could not win on the negative side of the question, because it is contrary to the laws of human nature and the trend of events. In closing, I will hope to never have occasion to discuss this question further in print, as it is an impossibility to do so and strictly avoid personalities. But, it is far better to *walk* in to-day, with an *honest heart* and a *clear conscience*, than to *crawl* in to-morrow.

LA JUNTA COL.

Ira D. Mayhall.

#### Equalization and Unification.

MR. EDITOR:—The article on "Progress and Poverty" in the May number signed by James Deegan is a very interesting one, and as I do not intend to go in any further details on the subject, I will only state my opinion, which is, that about nine-tenths of the article are based upon good solid facts and principles. There are, however, a few points that the writer has carried to an extreme both in reference to B. of L. F. and B. of L. E.

"The Articles," if adopted as they read, would not prove satisfactory, as there is left too much room for argument on either side and would have a tendency to still increase the surplus of engineers and firemen which the writer thinks has been one of the evils of the past. I have always thought that one engineer hired to one promoted would do justice to all concerned; the same rule in regard to firemen. Article 4 is as good as it can be made, for why should not engineers be satisfied with \$125 per month? Engineers' pay is nearly all over the country \$4 per day, which would give \$124 in a thirty-one day month and there should be a law to prohibit engineers from making more than \$125 in any one month. Then there would probably be but few idle engineers, there would be a few more promotions to

some of the boys that justly deserve it, and the surplus of engineers and firemen would be very small. The engineers have for the last few years been bothering their heads how to reduce the surplus of engineers, but they have never found any other method than the old song, "to quit making engineers stop promotion," and at many places hard feelings have existed on that account between engineers and firemen. But why do not the engineers sacrifice a little in a matter that seems so important to them? Why are they not satisfied with making standard pay every day? No, if they could only stop promotion for two or three years the firemen would be the only ones that would have to suffer and in the meantime they can make from \$175 to \$250 per month, may be more, while their brothers are hunting for a job and their poor families are nearly starving. It seems that when the time comes that he can make a little that justly belongs to others, he will desert his friends and brothers, sympathy and feelings are gone, and he has sold his principles for—money!

The idea is very good in regard to all members of B. of L. F. joining the A. R. U. It would be a very progressive step, and why should the firemen not do it, if they are not as narrow minded as some of the members of the B. of L. E.?

But should not also the engineers join the A. R. U.? But how can they without expulsion from the B. of L. E.? The ten thousand engineers that have not joined the B. of L. E. should join the A. R. U. at once, for if they were able to detect the B. of L. E. to be a useless institution and for that reason did not join that order, they also ought to be able to see the advantages in the A. R. U.

Then the other ten thousand engineers (for I presume there are about that many) that have joined the B. of L. E. but are also members of the B. of L. F., should join the A. R. U. and find out whether the B. of L. E. would not rather have some A. R. U. men in their order than have them expelled, for sooner or later the B. of L. E. will be forced to change the article in their constitution that prohibits an engineer that belongs to B. of L. E. from being a member of any other labor organization than the B. of L. F., for if not, the B. of L. E. will in the near future decrease worse than it did when no B. of L. E. member was allowed to be a member of the B. of L. F., and it must be taken into consideration that B. of L. E. will have to be "forced" to change its laws for its own benefit, and the sooner it is forced the better for itself and all concerned.

In conclusion we hope that the vast army of engineers in the South and West, of which nine-tenths are in favor of federation,

will soon take a decided step and join the A. R. U., as that is certainly the quickest, most effective, proper and complete way of federation for railway employees.

*J. Weeman.*

FT. WORTH, TEX.

#### Relief of the Needy.

MR. EDITOR:—About as regularly and as often as Lodge No. 99 meets—bi-monthly—for the transaction of business, there appears upon our table some communication asking for alms, and mostly for members of the B. of L. F. The most pleasant way of soliciting alms seems to be the putting up of some useful or ornamental article to be raffled for. These communications are always accompanied with tickets—usually four at a quarter of a dollar apiece—and it is hoped and expected by the solicitor that the lodge will draw an order for the amount of the full value of the tickets. These solicitations have become so frequent that we have decided, as a rule, to ignore them. In doing this we are not unmindful of the unfortunate condition of many brothers, neither do we become insensible to the appeals of charity. We, as a lodge, recognize them and provide for them among our own members, by the payment of weekly benefits in cases of sickness or disability. Under this system we have disbursed hundreds of dollars, and no member of No. 99 has become an object of charity through a raffling scheme. Having adopted rules and regulations to govern the payment of such benefits, we collect from each and every member \$5.75 per quarter. Of this amount \$4.00 per member per quarter goes to the grand office for beneficiary claims, leaving \$1.75 per member per quarter to be applied to the general fund of the lodge, from which our weekly benefits are paid, together with other incidental expenses. The amount of money thus raised was sufficient for several years to enable us to pay \$5.00 per week sick benefits. We were then paying for 26 weeks, if the sickness or disability continued that long. Having one case in which we paid for the full time, and several others for which we were called upon to pay from 10 to 18 weeks' benefits, we were forced to levy special assessments. This caused us to reduce our benefits from \$5.00 to \$3.00 per week, and to reconstruct our laws so as to prevent impositions which had been practiced upon us. As a result of such changes, we have, during the past year, replenished our treasury so that we are able to restore the \$5.00 weekly rate, but the limit of time is to be 10 weeks, and the maximum amount to be paid \$50. Under our present regulations we expect that \$5.75 per quarter will pay our pro rata share of beneficiary claims, and all of our sick benefits. But, if necessary, we shall

resort to special assessments to keep up our weekly benefits of \$5.00. Our members have grown to regard this policy as essential and beneficial as any feature of our organic existence. Providing thus liberally for our own members, we can see no reason why we should be called upon to help to sustain members of other lodges. If other lodges would adopt the same, or some similar system of paying weekly benefits, we think there would not be an excuse or necessity for a resort to the nefarious raffling scheme—a scheme possessing all the elements of a lottery, though presented in the guise of alms or charity.

*J. B. Ward.*

ROCHESTER, N. Y.

E. L. RILEY, a prominent member of the B. of L. F., is announced as a candidate for representative. He is well known as an active worker in the field of organized labor and if elected will undoubtedly devote his time and ability to furthering the interests of his constituents. The workingmen of his district will find him true to their best interests.

ONE of the "rights of man," which the leaders of strikes failed to mention, is the right to work. Senator Wolcott of Colorado made a telling allusion to this in a speech in the senate the other day in reference to the "industrial army" disturbances. He said:

I believe the time has come when those of us who are in public life ought to begin to cultivate more regard for the perpetuity of republican institutions and to pander less to that mis-called portion of the labor vote whose labor is with their throats and never with their hands. It is time that we stood for American manhood, for the right of every man to work if he wants to, if it takes the whole army of the United States to enable him to do so. The right of every man is to enjoy equal liberty with every other man and that means that he shall have such liberty as is not inconsistent with equal rights of his neighbor; the right to hold and enjoy the property which the laws of the country have enabled him to secure. It is time we had the courage to stand together against this socialism, populism and paternalism which is running riot in this country and which must end (if not crushed) in destruction of the liberties which the laws give us, liberties which should be dearer to us than life itself.—*Railway Age.*

THE man who lets his wife split all the wood may mean well, but he shouldn't be allowed to do all the talking at a prayer-meeting. —*Ram's Horn.*

**COME ON, BOYS!**

Come, boys, and mount the burning deck—  
Our orators speak rapidly:  
We long once more to reach the shore  
Of "Isler rolling rapidly!"

To half the campaign speeches  
We do not much incline;  
We want the fellow who was born  
"At Bingen, on the Rhine!"

The campaign music fills the air  
And jars from left to right:  
Once more, once more we yearn to hear  
Old "Curfew" ring to-night!

The orators keep mouthing on,  
And every one's a bore;  
We want the burial of Sir John,  
Whose other name was Moore!

So mount the burning deck, and shout,  
While fast the fires glow;  
And lead that lamb of Mary's out,  
Whose "fleece was white as snow!"

—*Atlanta Constitution.*

**A Memorable Day.**

The most memorable phenomenon of the heavens in modern times was that day of remarkable darkness over New England May 19, 1781. That day, says a writer in the *Chicago Times*, made a more profound impression, has been more written and talked about, than all the auroras, comets and meteoric showers within the last five centuries. The great astronomer Herschel placed it in the domain of the unexplainable. So pronounced was the darkness that settled down over the earth that fowls went to their roosts, horses and cattle showed distress, dogs whined, and thousands of persons anticipated the dawn of doom. The great colonial struggle for American independence was still in progress, the federal union was not yet established; there was that chaotic state that generally precedes great changes, and there was considerable rancor in the minds of the people.

Patriot and royalist each regarded the ominous sky and the threatening gloom as the evidence of Heaven's displeasure against the other, and the general conclusion was that the impending mystery would culminate in the fate of Sodom and Gomorrah. The ignorant gave way to all sorts of grotesque conjectures, and the few profounder minds were unable to advance any rational explanation of the very unusual occurrence.

The legislature of Connecticut was in session on this ill-omened day, and most of the members made no secret of their belief that now had come the great day foretold in the apocalyptic vision. A member got up and proposed adjournment. The matter being open for discussion a legislator named Davenport arose and said:

"Mr. Speaker, it is either the day of judgment or it is not. If it is not, there is no need of adjournment; if it is, I desire to be found doing my duty. Let candles be brought and let business continue."

But the motion to adjourn was decisively carried, and the law makers who fashioned the laws for the "men of steady habits" went forth from their chamber to gaze at the weird and somber sky.

It was Friday and the intensity began soon after ten o'clock a. m. and continued till past the middle of the following night. The wind was from the southwest, and the darkness seemed to come with it from that direction. It soon became too dark to read common print readily, and candles were lighted in order to attend to household duties. After a time the breeze subsided; a dead calm followed and added to the solemnity. The darkness was all over New England, westward as far as Albany, N. Y., southward along the coast of Maryland, South Carolina and Georgia, and northward as far as any communication was had with any settlements.

Nothing was known beyond these boundaries, but there is reason to believe that a much greater area was involved.

Prof. Williams of Harvard college, was indefatigable in observing, collecting and recording reports of the conditions attending this phenomenon, and to him the credit is due for the data from which it is possible to deduce the causes of this soul-harrowing dark day. Mr. Williams professed himself unable to offer any solution, but this was probably owing to the lack of knowledge of the physical interior of this great country and its sometimes peculiar relationship to current meteorology.

All was black as primeval night when chaos ruled the world and sun and stars were as inky spots in the heavens.

And now we come to the key that unlocks the mental situation, and it becomes clear what it was that stood in the way of an understanding of this mystery. Innumerable were the grotesque and irrational hypotheses that were advanced from which their advocates endeavored to find the solution of this extraordinary occurrence.

An eclipse of the sun was claimed, but as the moon was near its "full" and probably one hundred and eighty degrees out of solar line from the earth, such a condition was physically impossible. A transit of Venus, or some other celestial body across the sun's disc, had advocates. Men of grave demeanor contended that a star had caught fire and started a conflagration of the heavens, or the sun had expired, hence the residuum of smoke and ashes.

There had been immense land fires, where there was no one to report, covering perhaps many hundreds if not thousands of square miles, probably fanned by brisk gales, the vapor and sooty substances taken up by ascending currents from the heated surface and loaded on favoring breezes to

be wafted over the land of the pilgrims and, as it chanced, to be air-dammed, with the results narrated. This continued until the barrier gave way, when the vapor soon dispersed.

The great middle and western states have time and again had this smokiness, which no one now thinks of regarding as supernatural. The only unusual feature of this occasion was the unusual combination of conditions.

This, in brief, is the explanation of the wonderful dark day.

### "Fly by Night."

I presume that most people who visit the theater have heard the term "fly by night" applied to minor and unstable theatrical companies, but I believe there are very few, if any, who understand the meaning of the term, and among even the present generation of actors there is probably none who knows how the term originated.

It was in the days when old Sol Smith, dead and gone these many years, had a strolling company which played in only the smallest and queerest of all the small queer towns in the south and west. Smith and his company were playing a varied repertory, as every company had to do at that time, of which "Macbeth," with all of Locke's original music, was a prominent feature. But the public proved unappreciative, and the times were hard. Soon old Sol and his company were at low water mark, and at length found themselves stranded in a little Kentucky town, from which a flinty hearted landlord refused to permit them to remove their baggage until they had liquidated his claim against them for board.

Smith felt that he was equal to the emergency, having "been there" often before, and he cast about in his mind for some means of deliverance. At length he hit upon a plan. He engaged a countryman to bring a strong wagon, drawn by a pair of sturdy horses, under the window of his room at the back of the tavern at a certain hour on the following night. The members of the company were let into the secret, and it was arranged that on the night in question they should throw the landlord off his guard by assembling in the parlor and practicing one of the witches' choruses composed by Locke for "Macbeth" and entitled "We Fly by Night," in which those words are repeated over and over again. Meanwhile old Sol and his most trusty henchman were to lower the trunks from the window to the countryman, who was waiting below to receive them.

This programme was carried out to the letter. The company was singing "We Fly by Night" for dear life in the parlor, while Smith and his man Friday were letting

down the trunks with as much celerity and quietness as possible, but, alas! not, as they fondly thought, into the hands of the countryman who was to convey them to a place of safety, but into those of the landlord, who had somehow or other got wind of the scheme.

At length the work was completed. Old Sol and his companion, with a great load lifted from their minds, joined the company in the parlor and united with them in singing "We Fly by Night." But just as they had sung those words for the third time the door opened, and the landlord, entering, said, with a winning smile, "Excuse me, ladies and gentlemen, but you won't fly this night, for I still have possession of your trunks."

From that to the present all queer dramatic and musical companies have been known as "fly by nights."—*Joseph Jefferson in New York Herald.*

### A Clever Stratagem.

Once during the Iron Duke's campaign in the Pyrenees, it happened that General Picton's disposition for receiving the assault of Marshal Soult displeased him. The danger threatened from in front, and the difficulty lay in delaying the attack until Wellington could effect the change he wished. He was, as usual, equal to the occasion. Waving his bat in the air he galloped to the front of a regiment as if he meant to order a charge. The whole of Picton's line cheered tremendously, and as the roar died away Wellington was heard to remark, half to himself: "Soult is a cautious commander and will not attack in force without ascertaining the meaning of these cheers. That will leave time for the Sixth division to come up, and we shall beat him." This was exactly what happened, and Soult sustained a bloody repulse where he might have won an easy victory.

### The Voice in Men of Different Races.

The Tartars are supposed to have, as a nation, the most powerful voices in the world. The Germans, according to the *London Lancet*, possess the lowest voices of any civilized people. The voices of both Japanese and Chinese are of a very low order and feeble compass and are probably weaker than any other nation. Taken as a whole Europeans have stronger, clearer and better voices than the inhabitants of the other continents.

Doctor—Have you followed my advice in regard to eating plain food and keeping quiet at home? Patient—That's all I've been able to do since you sent in your bill.  
—*Yale Record.*

## Proverbs of the Day.

A prodigal picks his own pocket.

Empty threats make lying children.

Don't go to the wrong shop to get shaved.

A stinted wife can find a vest pocket in the dark.

If we had eternal sunshine we would have no crops.

The dangerous end of a rattlesnake makes no noise.

The aggressive man always finds the hornet at home.

Some people mistake getting religion for a receipt in full.

There is a Lazarus for every crumb from the party table.

When I go to a revival I don't want to listen to a blackguard.

One demagogue is more dangerous than a dozen aristocrats.

The man who gives himself away is not always worth taking.—*Chicago Herald.*

## Here's a Tall Fish Story.

"This seems strange, I'll admit," said the second mate of a coastwise steamer in a west side saloon recently, "but it's true.

"I was mate on board a sailing vessel plying between New York and Rio. The day before we sailed on one occasion we noticed a school of minnows swimming about the kitchen port hole, from which the cook threw out slops and scraps. The fish remained with us day by day. We were sixty days making Rio, and—would you believe it—the fish had grown from minnows to ten and twelve pounders when we at last threw anchor in Rio harbor. Who's a —? I can prove it."—*New York Herald.*

## Remarkably Considerate.

A Cincinnati newspaper reports a striking manifestation of amiability on the part of a little maiden of that city. A beautiful new doll had just been given her, and as she sat holding it and singing to it her mother noticed that the old one was not in sight. "What have you done with Beatrice?" asked the mother. "I've put her away," answered the little girl. "If she saw me loving my new baby it might hurt her feelings."

"Don't you think Miss Biggs has a peachy complexion?"

She—"I'd not thought of it before, but she has a kind of frost-bitten look."

Dear woman wants the earth for sleeve,  
She wants the sky for hat;  
She also wants a knot hole when  
She sees a mouse or rat.

—*Boston Transcript.*

## Sharp Practice.

"It was the queerest thing," said the girl at the jewelry counter during the lull, according to the *Buffalo Express*. "When I was in the other store up town the floorwalker came around and told us all to look out for those people that go around and steal because they can't help it. I was kind of green, then, and I almost put my eyes out looking for them. One day a woman came to the counter and I didn't pay much attention to her. After I was through with the party I was waiting on I happened to look at her and saw her take a gold-headed hairpin from a tray.

"I didn't say a word, but I found out who she was. That night I went right over to her house and told her what I had seen. She tried to brazen it out, but I was too much for her, and finally she owned up that she had taken the pin."

"Did you have her arrested?" asked the other girl.

"No," said the first girl, but I made her give me the pin."

Then she turned her queenly head, pointed to something glittering in her hair and asked, proudly: "Ain't it a bute?"

## An International Family.

A typical southern African household described by Oliver Schriener had an English father, a half Dutch mother with a French name, a Scotch governess, a Zulu cook, a Hottentot housemaid, and a Kaffir stable boy, while the little girl who waited on the table was a Basuto.

## Ha! Ha!

No doubt Goliath was much surprised when David knocked him down with a stone from his sling. Such a thing had never entered his head before.—*Gilens Falls Republican.*

"I think Mrs. Crankford must be getting on beautifully with her lessons at cooking school."

Mrs. Fling—"Did her husband mention it?"

"No, but he's taking all his meals down town now."

"Doctor, I want to know if you can pull a tooth for me right away?"

Doctor—"Certainly; will you want something to kill the pain?"

"Oh, it doesn't matter; it's my husband's tooth."

"You still are calling upon that pretty little Mills girl?"

"Yes; engaged now."

"Do you like her father?"

"Yes; he's out of sight."

**DON'T BLAME THE WORLD.**

Don't blame the world because the thorns are found  
among the roses:  
The day that breaks in storm may be all sunshine  
when it closes.  
We cannot hope to always meet with Fortune's fond  
caressing;  
And that which seems most hard to bear may bring  
with it a blessing.

The buried seed must rot in earth ere it produce the  
flower,  
And the weak plant to fructify must have both sun  
and shower.  
So man, to gain development, must struggle with  
life's crosses,  
And view with calm philosophy his trials and his  
losses.

A deadly, pois'nous weed may yield a salve of surest  
healing;  
The sweetest bloom may pois'nous be although its  
bane concealing.  
Things are not always what they seem, but still 'twas  
Heaven designed them,  
And we should class them all as good, and take them  
as we find them.

Little we know of this brief life, and nothing of its  
sequel;  
Then let us take in humble trust all that may seem  
unequal.  
God's ways are not our ways, and He should certainly  
be trusted;  
All that is wrong, in His good time, will surely be  
adjusted.

**The Story of a Model.**

Posing is becoming a finer art and attracting more women to it every year, especially in New York and the larger cities, where artists find inspiration and congregate for work and to show the world their accomplishments, says the *New York Press*. Good models are the hardest thing an artist has to find, as every artist knows. Moreover, the best models are snapped up at once, and to succeed the artist often has to call in the aid of the photographer. So necessary has the artist found the photographer to be that there is one place on West Twenty-third street where a first class photographer, who did not succeed as an artist, has made a great success of photography for artists, and much of his work is done with the models whom artists bring to him.

The artist and model appear after the model has posed in the artist's own studio several times and he decides just what he wants. It may be a hand and arm or a head and drooped eyelids. A tempting smile, a coquettish glance that no woman can preserve for days in a studio pose are often wanted. When an artist finds a good model he is apt to have her photographed in many positions.

This photographer makes a specialty of undraped figures, but none except the persons for whom they are made ever gets so much as a peep at the results, for the photograph is the property of the artist who brings the models.

The original of certain exquisite character photographs which have attracted the

attention of people from all over the country is a charming model, who has very few flaws in her physical composition and heartily enjoys posing. Many models have only the requirements for a certain line of pictures, like the old Greek now in this country who has been painted or sketched as Sophocles over three hundred times. The model who delights the artist's heart is one who can pose for anything, from a milkmaid to Venus.

The girl who poses in New York for pure business comes sometimes from a race of models and has traveled with her family straight from the atmosphere of the large studios of Rome and Florence. More often she is some American girl or of mixed parentage, who has fallen on evil times, and the stories of New York's poseurs of the studios would make dramatic and sad reading.

Into the art league life class one night walked a young southern girl, who is bound to make a place for herself in time. The model was already in position, and as she passed to her easel she looked at the platform to see what the new model was. For a second she couldn't believe her senses, for there stood a girl of one of the oldest southern families. The last time she had seen the model was at a Virginia house party, where the model had been the pet of a large circle and no girl was so beautiful or so admired.

When the first rest was called the young student went to speak to the model, whose face flushed red for a second, and then the two girls sat down and talked it over. Hard times had come to the beautiful girl. Her father died. Their financial affairs were entangled and with only a little money and a fine voice the girl and her mother came to New York, where the girl's voice soon secured her entrance to one of the most aristocratic choirs in the city. She foolishly married a college boy. Now, with a little baby, she is supporting her mother by posing in the nude. "But don't let mother know," she added. The girls of the class had drawn around the two and asked her to sing. There is a feline mascot in the league that had been purring around the model.

When the students begged the girl to sing she was very willing, and with the pretty kitten clasped in her arms and the drapery half pulled around her white, babylike shoulders, the girl sent her beautiful voice swelling out into the studio.

Such a slim, slip of a girl standing there, less than nineteen years old. Thoughts of the little baby deserted by the father, thoughts of this wee girl model secretly earning money to keep her baby and mother came to all the girls, and when the lovely voice took up "Come unto me, all ye that

are weary and heavy laden," there was hardly a dry eye among the girls, and if they only could have put the model onto canvas as she was then, somebody would have won fame.

### He Was an Experimenter.

The young man on the opposite side of the table studied the bill of fare for some time, while the waiter stood on one leg with his ear held out for the order, and then he said: "I want some of that hominy and a side order of maple syrup, a little spinach, some sweet corn, and a cup of chocolate." The waiter slowly moved his lips in amazement, says the *Chicago Record*, and had the order repeated. He smiled and started away, and the young man looked after him frowning:

"Confound these waiters," he said, "I suppose they expect every man to order something conventional, like steak and coffee or liver and bacon."

"You did put in a queer order," was suggested.

"Oh, I don't know. It may turn out to be a good combination. I'm experimenting all the time."

"Experimenting?"

"Yes; I try new combinations. How did people ever find out that jelly and roast duck go together? How did they ever get on to spring lamb and mint sauce, pie and cheese, steak and mushrooms, and so on? Why, by trying new combinations. I order whatever strikes my fancy, and in that way I get some good combinations."

"What are some you have discovered?"

"Scrambled eggs and cranberry sauce is one. Cold pigs' feet and lemon ice is another. Did you ever dip slices of banana into hot bouillon? Of course not. There are no fixed rules about things—you must experiment."

### Friendship in the Family.

One of the most important requisites of home life, and one frequently overlooked, is the intimacy that should exist between the parent and the child. This is, indeed, the foundation on which all good influences may be most securely laid. The control which is obtained through fear, or force, or bare authority, has nothing abiding in it. As soon as the fear is outgrown, or the force removed, its power will pass away. But the influence which is at work where real sympathy and friendship exist between parents and children will abide long after the relation itself is severed, and will enter as a powerful factor into the whole life.

A line of employment quite pleasant these days, when the skies are so blue, and the soft, gentle rays of the sunshine in springtime get into the soul. Is a fish line connected with a hook and a pole.

—*Detroit Free Press.*

### A \$98 Tennis Gown.

This is certainly the age of ready-made gowns, and there is a range of prices as varied as the incomes of the population of the United States. Yachting and tennis gowns have I seen within the last few days ranging in price from \$2 48 to \$98.

The \$98 one was a very smart creation of dark blue serge—the best kind of English serge, made with round skirt, draped a little at the hips to show an under petticoat, and with a very smart little zouave jacket, to be worn over a white silk skirt, fastened with pearl buttons, on which were tiny blue anchors. The jacket, on either side, had three large pearl buttons, with gold anchors, and a jaunty little yachting cap had a gold anchor in front.

The \$2.48 suit I only saw in a shop window, where it looked really very smart. It was of brown duck, with plain gored skirt and a short, full jacket, worn over a red waistcoat. As to its appearance after a few weeks of wear I should not like to be responsible. The \$98 one would certainly last many years. But between the two there is a great gulf fixed, which, fortunately for the hundreds of women who have to buy their own clothes, is filled with plenty of suits in which they can look well by the outlay of not many dollars.

### Worship of a Hero.

A reference to the welcome which Emerson gave Kossuth reminds a Boston *Transcript* writer of a story that Louisa M. Alcott used to tell. The Alcott children, says the writer, were always hero worshipers. They had heard from their brave, great-hearted mother the story of Kossuth's work and Kossuth's country, and finally they were taken to hear him speak. They came home thrilled with the inspiration of it, and then lamented bitterly that they had secured no relic of the great patriot, however insignificant, which they could enshrine and worship as their fashion was. But Anna—the gentle, timid Meg of later time—drew, exultingly and blushing, a glass goblet from beneath her cloak, and whispered: "He drank from it!" "She had rushed in," said Miss Alcott, "where we other vandals feared to tread. While the father was soaring with Kossuth into the heroic empyrean, and we all stood round, amending so to speak, Anna had stolen close to the desk, and whipped the goblet under her cloak. We built a little shrine for it, and hung it on our chamber wall."

Editor—I regret, Mr. Barnstormer, that my paper referred to your starring trip as a "starving one." Mr. Barnstormer—Don't mention it. Your statement was absolutely correct.—*New York Journal.*

### A Mild Fish Story Teller.

"Let's see," mused the drummer at a Detroit hotel the other evening, "but isn't there a place around here somewhere called Lake St. Clair flats?"

"Yes, sir," replied the alderman in the group.

"Great place for fishing?"

"The best in the world."

"Always sure of getting fish at the flats?"

"Always, if in season."

"I've read and heard a great deal of the place, and I know several Cincinnati people who have been up there. One of 'em told me he caught four perch up there between sunrise and sunset."

"Only four!" gasped the alderman. "Why, my dear sir, what could your friend have been doing all that day?"

"Fishing for perch. He didn't even stop for dinner. Another one told me that he caught three black bass during the week he made a business of fishing, but of course—"

"Only three black bass in a week! I'd like to know what sort of a fisherman your friend calls himself?"

"He is rated an A1 man, but I am sorry to say nobody has any confidence in his word. His story wasn't quite as bad as that of his brother, though. Say! There was a man who stood right up at the bar of the Burnet House and gave us his solemn word that he caught a pike up there which weighed two full pounds. He wouldn't take off a fraction of an ounce. They expelled him from a club for lying, but I have often wondered if he didn't really believe what he was telling."

"He didn't claim but two pounds for his pike?" demanded the alderman as he turned pale.

"Only two pounds. There was a Covington man in the party, and when he got back home he went around telling everybody that he hooked a fish so large that it broke his line. They were going to run him for mayor of the town but that killed him dead. People argued that if he would lie about one thing he would about another, and that it wasn't a safe thing to put a liar in public office."

"Was that all he claimed—that a fish broke his line?"

"That's all, but it settled his hash pretty quick. So there is good fishing at the flats, eh? I'm glad to meet a man who knows all about it. Now, alderman, I wish you'd give me a few particulars."

"No, sir! No, sir!" exclaimed the alderman as he jumped up and mopped the perspiration from his brow.

"Won't you tell me how many perch you have caught in a month up there?"

"No, sir!"

"Nor the weight of your largest fish?"

"No, sir!"

"But you see, alderman"—

"I see nothing! I won't tell you one durned word about fishing. I was given to understand that you were an honorable, straightforward man, but I have discovered to the contrary. No, sir—not a statement—not a word. A man who'll choke another man off as you have me can go and fish in a mud hole and be hanged to him."—*Detroit Free Press.*

### A Receptive Mind.

Theophile Gautier, the French author, was gifted with an extraordinary memory. Whatever he had heard or seen remained engraved upon his mind.

On the day on which the two first volumes of Hugo's "Legende des Siecles" were published, the author dined in Gautier's company at the house of another friend. There were several literary men present, all allied more or less closely to the tribe of romanticists, admirers of Victor Hugo, and counting upon finding a feast of good things in his new work.

In the course of the talk Gautier remarked: "Let us prove what we advance. I will recite 'Les Lions' to you." And in a clear voice, his eyes gazing steadfastly as though he were reading from afar a book visible to himself alone, he recited the whole piece, not repeating himself once, never hesitating, and not mistaking a single syllable.

Yet he had read it that morning for the first time.

Many times his friends, doubtful upon some point of history, language, geography, anatomy or art, referred the matter to him, and received immediate satisfaction. They used to say then: "We have only to turn over the leaves of Theo."

### A Cause of Agreeable Maladies.

Village Hotel Keeper—"So you think it's queer so many ladies fall sick in this small place, do you?"

Stranger—"Yes."

Village Hotel-Keeper—"Then you haven't seen the new doctor. He's the handsomest man in seven counties."

### His Notion of an Ideal Union.

Weary Watkins—"They's only one thing keeps me from becomin' a workin' man and joinin' a union."

Dusty Rhodes—"What's that?"

Weary Watkins—"I can't find no union what's on a strike all the time."

### It Was too Kind to Her.

She—"They say this photograph doesn't do me justice."

Her Younger Brother—"Well, I wouldn't feel hurt if they do say so. Justice should always be tempered with mercy, any way."

### Woman's Soprano Voice.

The scientist who discovered in the human larynx the anatomical reason why woman has a soprano voice and man a bass one was a woman, Mrs. Emma Seiler. She was a German, born in Wurtzburg. Left a widow with two children to support, she resolved to become a teacher of singing, but suddenly lost her voice. Then she determined to find out why; also to discover if possible the correct method of singing, so that others might not lose their voices. For this purpose she studied anatomy. She dissected larynx after larynx and spent years in her search, trying to find for one thing why women's head tones could reach high C while men had no soprano tones. At length her search was rewarded. She discovered under the microscope one day two small, wedge shaped cartilages whose action produces the highest tones of the human voice. She made her discovery public. It excited great attention among scientists. Her own brother, a physician, praised the treatise in the highest terms till he found his own sister had written it. Then he dashed it down, saying in a rage that she would better be attending to her housework. Mme. Seiler's portrait, a marble relief, is in possession of the American Philosophical society of Philadelphia, of which she was a member. She wrote among other books, "The Voice in Singing" and "The Voice in Speaking." She died in 1886.

### A Foolish Belief.

"There is a generally believed theory in regard to alligators' nests," said a Florida man recently to a representative of the *Globe-Democrat*, "which is entirely erroneous. The popular idea is that the mother alligator never goes out of sight of her eggs, and that if anyone disturbs the nest their life insurance policies are worth par in a very few minutes.

"I was not an alligator expert when I went down on Indian river for the first time, and was ignorant of the dire consequence of touching alligators when they were still bottled up in a shell in a liquid state. Seeing a nest and three eggs on the bank of the river, I captured them, without seeing any maternal saurian, and took them home with me. Here I put the eggs under a stove, and in the course of a few days they hatched out.

"The reptiles broke through the sides of the shell, which remained fastened to them by umbilical cords and did not free themselves from their late place of residence for several days. They were fierce from the moment of birth and would strike at anyone who approached them. Running around with the egg still attached to them

and their mouths wide open, they presented a strange spectacle.

"Since then I have robbed several nests when the parent alligator was out calling upon the neighbors, and I have never yet caught a glimpse of any enraged saurian hastening to avenge the abduction of her embryo offspring. The nests are not found very frequently, but when they are and there are no reptiles in sight they can be robbed with perfect safety to the robber."

### "Paying the Piper."

How many times we have heard the expression "pay the piper," and wondered where it originated. Perhaps some of you have heard the legend, but for the many who have not I will tell it. In all likelihood it came from the old and celebrated German legend of "The Pied Piper of Hamelin." Robert Browning has given us a pretty description of the legend in a poem of the same name. The story tells that a young musician, dressed in disguise, came to Hamel, a flourishing town in Brunswick, and offered to rid the town of the rats which had infested it for so long a time. He wore a fancy coat of many different colors, hence he was called the pied piper. The commissioners of the town gave him orders to destroy the rats, and promised him a reward when he should have done so. But after the work was completed the promised reward was withheld, and the piper in revenge blew his magical pipe again and by its wonderful tones drew all the children of the town to a cavern in a hillside. The opening of the cavern was closed as soon as the children had entered, and their parents never saw them again. And so our proverbial expression, "pay the piper," sprang from this legend, and it conveys a warning to all men to pay everyone his just dues, or to be on the lookout for a revenge as cruel as that of the Pied Piper of Hamelin.

### A Creeper for Baby.

One of the latest and best of utility "creepers" is very easily made. Gingham is the fabric used. First measure baby's length and breadth, in order to allow the little one a chance for freedom of motion. The gingham is then cut bagshape, 12 by 14 being the popular number of inches. This, when sewed up at the sides and bottom, is gathered into a band with buttonholes and buttons. In each lower corner openings have been made. These are hemmed and are then ready for the chubby legs. Drawing them up over the child's limbs you will find the dainty clothes snugly incased and yet the limbs of the tottler at liberty to move at will.

**BECAUSE WE LOVE.**

Sweetheart of mine, since we were wed  
 The second summer now is here.  
 And love grows stronger every year.  
 We are so happy, sweet, I said:  
 Why is it? she answered loud:  
 "Because we love each other so."

Oft have I heard the moaning dove  
 Call her lost mate from out the wood;  
 She suffered, felt and understood:  
 For she was filled with grief and love.  
 Such sorrow may we never know,  
 Because we love each other so.

—Cly Warman, in *N. Y. Sun*.

**The Bible in Point Alphabet.**

The only Bible published in the point alphabet to be used by the blind has lately been printed in Louisville. It consists of 1,839 pages, is in eleven volumes, and was turned out by the American Printing House for the Blind, which is an annex of the Kentucky Institute for the Blind. The eleven employes of the printing house were engaged on the work for about ten months, and on May 7, 1894, just a little over a year after the work was begun, the first shipment to the American Bible Society at New York was made.

Of course this is not the only Bible that can be read by the blind. Those thus afflicted have been reading a Bible for the past forty years, but it was published in what is known as the line alphabet. The line alphabet and the New York point alphabet differ from each other very greatly. The former is made up of the Roman letters enlarged and raised on the leaves of the book, so that the blind reader may know them by following their outline with his fingers. Every school child can read a book printed in that way. But with the New York point alphabet it is different. Each letter is represented by a different number of raised dots arranged in a fixed position. Strange to say, this second method is easier to learn, and is always taught before the line method. It may seem queer that the Bible published forty years ago did not come out in the point language, but that was because only the line alphabet was known then.

That any sort of a Bible for the blind came out at all is due to a bequest of \$40,000 made to the American Bible Society by a wealthy woman of New York city. It was made a permanent fund for printing Bibles for the blind. The first work was published in Boston, where the only publishing-house for the blind in America was situated. All the printing of Bibles for the blind was done at Boston up to 1883, when the second American printing-house for the blind was established at Louisville.

This was done by a special act of congress. The bill authorizing the act was first introduced by Mr. Henry Watterson in 1876, and

was finally passed through both houses in 1879, through the efforts of Mr. Albert S. Willis, who was then the representative from this district. One of the provisions of the law is that the national treasury pay an annual subsidy of \$10,000 toward maintaining the publishing house here. The state of Kentucky was not to be outdone, so in 1883 it bought the present site of the publishing house adjoining the Kentucky Institute for the Blind, on the west, and had erected a three-story brick building. Since then this Western branch of the publishing house has been turning out text books and religious literature, both in the line and point alphabets, in large amounts.

During all this time the Bible fund had been growing, so it was concluded to have a new Bible, done in the point alphabet, published. The western branch of the American Publishing House for the Blind was the only house that could do the work, so orders were sent to Superintendent Hutton to begin on the volumes at once. The four girls who do the type setting began their part of the work April 28, 1893. As soon as one page was set up it was carried into the molding room and an impression taken. The page was then ready to be cast. It was carried down stairs and placed in the stereotyping machine. A thin coat of tin foil was then laid over the mold and a light pouring of metal made so as to melt the tin foil into the mold. Another pouring was then made to fill in the blank spaces between the lines and re-enforce the back. A piece of ordinary roofer's tin the size of the page was then laid over the back of the thin metal impression, and another light pouring made to make the two adhere when this had been cooled off the workmen had a true copy of the page on a very light, flexible plate of stereotype. All the rest of the 1,839 pages were treated in the same way, and on January 23, 1894, the day the last page was set up, the last page was also completed.

The work of printing was then begun. The leaves are necessarily very heavy, and, of course, can be printed on only one side. Four sheets or pages were printed at a time. When the pages were ready for binding six of them were grouped together and stitched with a wire. The inside edge of each sexto is bound by a cloth-lined cardboard guard. This is made necessary by the thickness of the leaves and the constant handling by the reader. When these sextos are bound together they make a volume varying in thickness of from three to four inches. The New Testament is included in three volumes, the old in eight. All of them are bound uniformly in Russian calf. On the back of each volume are the words Holy Bible in the point alphabet, and also in ordinary print. The books of

the Bible included within the volume are also indicated in the same way.

The whole work of printing the first set of this Bible cost just \$3,000. The cost of binding is actually a dollar a volume. It may seem that for the blind to have this Bible in their homes is an expensive luxury. But this is not the case. Provision was made that the sacred library might go into every home at really a very small outlay of money. The interest on the bequest nearly half a century ago has grown so that the book can be sold to the blind at really less than the cost of the binding. The whole set is sold at \$7, and the New Testament alone can be secured for \$5 less.

These Bibles are being sent out to all the schools for the blind in the country through the American Bible Association. It is expected that they will eventually take the place of the line Bibles, not only in the schools, but in every household where there are any educated blind who may care to read the scriptures.

Among the other work in the New York point alphabet turned out exclusively by the publishing house here in Louisville are the international Sunday school lesson leaves. The money to pay the expenses of printing these is furnished by private subscription, secured by the unaided efforts of H. L. Hall, a blind man, whose home is in Philadelphia. These leaves have been coming out for a little over ten years, and during that time 4,600,000 have been published. Up to 1892 the copy for these leaves was edited by Miss Alice V. Broadus, daughter of Dr. John A. Broadus. Since that date Miss Rosalie Broadus, a niece of Dr. Broadus, has done the work. The blind who are able must pay \$1.50 a year for the leaves, but the poor can have them for the asking. All they have to do is to apply to the nearest superintendent of a school for the blind and show that they really want the leaves, and they are readily and gladly furnished. So few of the 4,600,000 leaves printed have been sold that it can almost be said they were all given away.—*Louisville Courier Journal*.

#### Had It in His Head.

"Now, Willie" said his teacher, as school opened, "you may recite your geography lesson. Where is Afghanistan?"

Willie hesitated a moment.

"Don't you know?" asked the teacher.

"Yes: I've got it in my head somewhere, but I can't lay my brain on it just this minute," Willie replied.

#### AN ALIEN.

A man without country is he who is born in a nation where from him his birthright is torn by a law that deprives him of land or of leave To earn what the sweat of his brow should receive.  
*Charles W. Stevenson.*

#### A Quaker Christening.

An "up-to-date christening," which was recently held at an English country house in a sporting county, is described by an American girl in one of her home letters, and quoted in the *New York Tribune*.

"Milly is up and has taken to riding again, and is in her habit from morning until evening, when she slips into a lovely tea gown for an hour or so, to appear resplendent later on in gorgeous dinner attire," so runs the letter.

"The house is full of people, all of the hunting set, of course; so I was not in the least surprised when I was told that the baby's christening was to come off at the next meet and hunt breakfast, which was to take place at 11—Hall. 'I shall be sure of my godfathers and godmothers if I combine the two,' said Milly, 'and I think it will be a good send-off for baby,' she added with all seriousness.

"And so, just before they started, the child was baptised and christened, all the party, except the clergyman and myself, being in habits or boots and breeches. It was really a very pretty sight, however, with the two godfathers in their pink coats, Miss S., as godmother, in the naggiest of habits, with Milly standing by similarly attired, and the little pink shred of humanity in long lace robes. As soon as the ceremony was over, the entire party took horse and scampered away, leaving the small M. F. H. of the future to his nurses."

"There is a young country boy staying at our boarding house," writes a correspondent, "who is a perfect little gentleman in his way. The other day he brought his sister into dinner and gave her a general introduction somewhat as follows: 'Ladies and gentlemen, this is my sister.' Then he electrified the gathering by continuing: 'My sister, these are ladies and gentleman.' Whereat the ladies and gentlemen present were highly delighted."—*Chicago Inter-Ocean*.

A STEAM fire-engine for use along the line of a railway has been made in England, the design being arranged so as to permit the steam to be taken from an ordinary locomotive boiler. It is in fact a powerful double acting steam pump mounted on a car, so that it can be run to the scene of a fire by rail and then take steam from the locomotive which hauled it, thus saving the time of firing up, and reducing the cost of construction.—*The Engineer*.

Mamma—Did you ask God to make your little brother well, Freddie?

Freddie—Well, I should think so. How could I forget it when he has to have all the playthings while he's sick?

## TO YOU.

Vain the war against our passion's torrent,  
It was written we should love each other;  
Find our souls' completeness in the knowledge  
We were ever one in love unbroken.

Twain were we and sorrowful and weary  
Of the hollow masks about us lying;  
Of the empty laughter of the youthful,  
And the sadder laughter of the elders.  
Shadows in a world of shadows dwelling:  
Dreamers wrapped about with the ideal,  
And the world could go its way without us.

Then a word, a look, and all the silence  
Thrilled and throbbed with light, and sound and color.

While the shadows fled and left us standing  
Shudd'ring with the mighty pain and rapture  
Of our meeting souls. And life completed,  
Spread its golden veil upon foreheads,  
With its glow and glory surely hiding  
All the dark and evil from our vision.

What is silence save a sweeter language,  
Jared by no harsh sound of lips that falter  
Burdened with their weight of love and longing?  
Silence, and a look, and clinging fingers—  
These are more than all Love's fond expressions,  
Many words and ceaseless repetitions.  
Love from soul to soul is silent ever.

In the hands that clasp and lips that linger,  
Lives his deepest language—Words are feeble.  
Love me, then, in silence of the spirit,  
Knowing I am but thine own forever;  
Soul with soul in love and truth abiding.

*Clare Beatrice St. George.*

## An Indiana Mystery.

Singular and unexplainable phenomena are again attracting attention to the stone quarry on the lands of Charles Carter, a wealthy farmer residing a few miles south of Osgood, Ind. The quarry is located in the bend of Cedar creek, at the base of a steep and broken hill, and was first operated nearly fifty years ago. The stones were then removed in the tedious old-fashioned process of pioneer times.

One day an effort was made to remove a ledge of rocks by blasting with gunpowder. A heavy charge was fired, resulting in the dislodging of a vast quantity of stone and dirt and revealing several unsuspected graves that had been rudely fashioned in the buried rock. One of these subterranean vaults contained three skeletons. Two of the fleshless and crumbling forms were of giant proportions; the other of the trio, supposed to be that of a female, was of medium size, but encircling the bare bones of its lifeless limbs were numerous bands of silver and copper that had evidently been worn on the arms and ankles during lifetime as ornaments or tokens of rank. With the bodies of the stalwart companions, who had apparently been consigned to the tomb at the same time, were relics of rude weapons used by the Indians in early days, and were supposed to be the remains of warriors or chieftains entombed with the corpse of their queen or prophets.

The other vault contained a mass of mingled bones, and appeared to be the remains of a number of human beings buried

indiscriminately at different times. The long period that had elapsed since the interment had allowed tons of earth to slide over and accumulate upon the rocky receptacle of the unknown dead and completely obliterated all traces of its singular existence.

The ghastly find had attracted crowds of persons to the spot, but in time it was forgotten save by those whose ghostly superstition reminded them of the secluded tombs that had been disturbed by the ruthless hand of civilized man, and around which lingered the haunting spirits of the strange dead, incensed at the exposure and destruction of their resting place.

Several of the workmen refused to labor at the quarry after the removal of the crumbling remains, and for some years work was suspended at the old "stone diggings." In time the old premises changed hands, and the new owner, on coming in possession, resumed work at the abandoned quarry.

For several years the labor of getting out stone was continued uninterrupted, but one day when Chris Salless, who still resides in that vicinity, was engaged with a force of men drilling down below the bed of the creek, a rumbling sound startled the laborers, and soon the earth about them began to shake as if in the throes of an infant earthquake. Filled with alarm, the men rushed from the locality, and as they retreated rapid detonations disturbed the air, although no explosives or combustibles of any character were about the place. For days these strange sounds and rumbling reports seemed to roll from the bowels of the earth; and then a weird stillness followed that cast a depressing dread upon the returning workmen, and forced them, by the powers of preternatural fear, to forsake the somber shadows of the stone-girted glen. Once more the old stone quarry became deserted and abandoned. For nearly twenty years no stone has been quarried from its mysterious depths, but at varying intervals the singular sounds and peculiar commotions would recur, and, continuing for days, again subside with the stillness of years. During some periods of these eruptive disorders, small stones, dirt and accumulated debris would be hurled into the air a distance of thirty or forty feet. Perfect quiet has prevailed in the shunned locality for more than five years until last Thursday, when the singular phenomena again attracted public attention.

A Cincinnati *Enquirer* reporter conversed with Mr. Carter, the owner, and a number of intelligent and prominent parties, and recent disclosures lead them to the theory that probably the peculiar disturbances are occasioned by the presence of natural gas that at times, under an increased pressure, is forced through fissures in the rock and

produces the explosions that agitate the locality. But a majority of persons who know of the singular facts connected with the place are positive that the peculiar occurrence is produced by occult forces under the control of supernatural agencies, seeking to revenge desecration of the stony sepulchers of the savage dead, and with superstitious awe seek to avoid the place strenuously as they would the abode of the damned.

### Girls Who Sell Their Hair.

"Do we have many girls come to sell their hair? Well, I should say so, but we don't make a business of buying on account of the risk we would have to run," said a Pittsburgh hair dealer to a *Dispatch* representative, recently. "I have had girls come to me and offer to sell their hair as it was on their heads. No, they don't get good prices—one dollar and fifty to two dollars and fifty cents being as much as I ever gave. I know of one case, however, where a well-known society woman took a fancy to the hair of a young lady she met accidentally and she paid the highest price I have ever known for a head of hair. The young lady in question had a luxuriant growth of golden-brown hair and one day she was approached by this lady, who was compelled to use false hair, who said to her: 'Miss —, if at any time you desire to part with your hair, you can find a customer in me.' The young lady was in need of pin money at the time and said: 'Well, I am not particular about keeping it now, as it is a little too light for my taste.' So she agreed to have her hair cut and in payment received eight dollars and a half. If girls could always get such a sum for their flowing locks there would be a great many more short-haired young ladies about the city."

NEW YORK CENTRAL engine, No. 870, has been doing some good work during the past year. It has been doubling the road between New York and Albany, 143 miles, nearly every day with heavy fast passenger trains. It came out of the shop March 26, 1893, and continued in service until April 2, 1894—370 days. During this time it worked 360 days, and run 106,866 miles. There were but two slight failures during the year, causing delays aggregating forty minutes; thirty minutes of this time was caused by a broken whistle.—*National Car and Locomotive Builder*.

### Wakes Them Up.

When on a sultry day anything is said in congress about the new mint, every sleepy Kentucky member jumps to his feet, bows, and says: "Yes, sah; don't care if I do."—*McKenport Times*.

### Summer Breakfasts.

In hot weather the jaded appetite frequently turns from an Arcadian diet of fruit, vegetables, eggs and milk, and all else that is deemed healthful and seasonable, and craves something that will stimulate the palate—something quite different from the every day menu—a thing savory and piquant and high seasoned. At breakfast, especially, when the languid desire for food requires to be tempted, it is wise to have little relishes in the way of side dishes that may serve either as a substitute or an addition to the regular fare.

An appetizing dish is anchovy toast and poached eggs. Cut some squares of bread about three inches square and fry them a golden brown; spread them rather thickly with anchovy butter or any seasoned potted meat that can be rubbed down with butter to make it spread easily; then lay on it a poached egg neatly trimmed and garnished with sprigs of parsley. Another good breakfast dish for a relish is haddock toast. Pick the flesh from a smoked herring or haddock; pound it perfectly smooth with butter; then put it in a pad with very little cayenne and about an ounce of anchovy. Stir it over the fire, then pile on squares of fried and toasted bread, sprinkle with pepper and chopped parsley and serve hot.

THE record of the Union Pacific railway for the year 1893, in spite of the efforts of a management second to none in ability, is one of heavy loss—an impressive illustration of the general condition of the country. The principal results for the past two years are thus shown:

	1893.	1892.
Average miles operated . . . . .	8,167	8,149
Gross earnings . . . . .	\$37,445,417	\$45,025,176
Operating expenses . . . . .	27,386,019	30,144,675
Net earnings . . . . .	10,159,398	14,880,501
Total income . . . . .	11,169,060	16,496,851
Interest on bonds . . . . .	10,700,198	10,844,043
Sinking funds . . . . .	977,533	1,093,239
United States requirements . . . . .	1,218,423	1,358,133
Total expenditures . . . . .	13,845,921	14,427,094
Surplus . . . . .		2,069,757
Deficit . . . . .	2,335,841	
Earned on stock . . . . .		3.40 p. c.

In a single year the gross earnings fell off \$7,580,151, and although the expenses were \$2,858,656 the loss in net earnings was \$4,721,103. The largest decrease in earnings was upon the Colorado lines, owing to the silver crisis, and upon the Kansas lines, resulting from the failure of the wheat crop. The ratio of operating expenses to gross earnings for the whole system, including taxes, was 72.27 per cent., against 66.69 per cent. the previous year. The gross earnings per mile of road were \$4,688, against \$5,621 in 1892, and the net earnings, after taxes, per mile of road, \$1,300 against \$1,873.—*Railway Age*.

### Women and Marriage.

The federal census for 1890 reports that of the 19,602,178 women of marriageable age 6,233,207, or one-third, were unmarried. Over one-half (53 per cent.) of the women between 20 and 25 were unmarried, and 28 per cent. of those between 25 and 30, while 6 per cent. will never marry.

If a woman does not marry by the time she is 20, says the *New York World*, the chances are 53 to 47 that she will not be married until she is 25, and 28 to 72 that she will not be married until she is 30. To put it in simpler form, of every 100 women who reach the age of 20 unmarried, 47 marry between 20 and 25, while 25 marry between 25 and 30, and 6 never marry.

One reason why fifteen years ago 63 out of every 100 women married between the ages of 20 and 25, while only 47 marry now, is because many avenues have been opened to women by which they can earn a living without becoming the "servant in all but salary" of a man. Shorthand and the typewriter have opened opportunities for hundreds of thousands, and the commercial colleges have filled our cities and towns with clerks, bookkeepers and telegraphers of the gentler sex. Tasting the sweets of independence they apparently look askance at matrimony with its burdens and sacrifices.

THE big tunnel at Niagara Falls, by means of which the power of the falls will be used to generate electricity, is a marvelous piece of engineering work, and it is estimated that the company will be able to develop no less than 450,000 horse power by means of its several turbine wheels. The power is to be carried to great distances. For instance, a contract has been entered into to furnish power to mills in the eastern part of the state, several hundred miles from the falls, at the low cost of \$12 a year per horse power, running night and day.—*National Car and Locomotive Builder*.

### One of a Thousand.

Maude—"Isn't it funny he should fall in love with that fright of a girl?"

Elaine—"Not at all. She used to laugh at his jokes."

Jilson says it may be extravagant for the women to put so much material in their sleeves, but a great deal more goods would go to waist if the same fashion should prevail in men's attire.—*Buffalo Courier*.

"Did you tender your resignation?" said a man to an ex-office-holder. "I resigned by request, sir, but there was nothing tender about it. It was tough, sir."—*Pittsburg Chronicle*.

OF the possibilities of electricity the prospectus of a proposed "national school of electricity," to be established at Chicago under the auspices of Edison and a number of other eminent electricians, says: "More than \$800,000,000 are employed in electrical pursuits to-day, and these figures are being increased at the rate of \$100,000,000 annually. Within a decade nine-tenths of the steamboating, railroading, canal hauling, illumination, domestic lighting, heating, cooking, factory operation, mining and metallurgy will be done by electricity. There are also many applications of electricity yet in an undeveloped state. Electricity is the most promising field in civilization to-day." While the prediction that within ten years "nine-tenths of the steamboating, railroading, canal hauling," etc., will be done by this wondrous agency will doubtless prove extravagant, it is certain that the application of electricity to the practical arts is still going rapidly on, and none may venture to fix its limitations. In the single direction of urban and rural railway transportation the electric motor has made astonishing advances within the past ten years, and who can say that it may not eventually supersede the steam locomotive?—*Railway Age*.

GENERAL MANAGER ALLEN, on behalf of the Missouri, Kansas & Texas Railway, has presented engineer George Lyons of Parsons with a handsomely engraved set of resolutions by the directors of the company, extolling him for his presence of mind and bravery in saving an M., K. & T. train from bandits at Kelso, I. T., last November. Engineer Lyons was pulling train No. 3 one evening in November last: when at Kelso, I. T., the train dashed out the side track. Taking in the situation in an instant, instead of stopping, he pulled the throttle wide open and dashed down the track through the split switch at the other end. He was none too soon, for, as was suspected, bandits made their appearance and began to bombard the train with Winchesters. During the firing Fireman Milne was struck in the face by a ball, frightfully tearing his lower jaw. He was not forgotten, however, as the company will pay his expenses to New York, where he goes to have a difficult operation performed.—*Denison (Tex.) Herald*.

First Burglar—Any luck lately? Second Burglar—No. Worked all night on a safe and when I got it blowed open it was a folding bed.—*Puck*.

Judge Guffey—What passed between yourself and the complainant? O'Brien—I think, sor, a half a dozen bricks and a piece of pavin' stone.—*Raymond's Monthly*.

### Reign of Mexican Parvenues.

Mexican society has undergone a considerable change since the days of the empire; and this on account of the many revolutions through which the country has passed, the accession to power of parties hitherto obscure and the closer connection existing and each day becoming more developed between Mexico and the outside world, says a correspondent of the *New York Tribune*. The grand old families of imperial times have nearly all disappeared, and their place has been taken by the "parvenu." The don and the "mantilla" have passed away, and men and fashions of the present day reign instead.

Still, Mexico, in many things, clings to the past. It yet maintains its old family pride and certain customs and in many instances does not take kindly to the transition which is slowly but surely telling upon the nation. There exists in Mexico a strong line of demarcation between class and class, and between natives and foreigners. Society in Mexico is exclusive, and the entree into it is difficult to obtain, and when once you have succeeded in entering a great watchfulness and care have to be exercised to retain a good footing therein. For in spite of the warm welcome and effusive politeness shown to the newly admitted a little mistake will bring about coolness and ultimate banishment. There is no doubt that Mexican society is hollow and insincere, although their language is brimming over with honeyed words and phrases, in reality meaningless and unnecessary.

Naturally, life and customs differ in every household, yet in the home circle especially there is much similarity, from the presidential mansion downward, always excepting the "pueblo" (or poorer class), whose customs and mode of life are of a different character. They generally dwell in huts of adobe consisting of one room, the only light they receive being admitted through the door. Their food is unvaried—viz., tortillas, frijoles and chiles; and their drink pulque, the old national drink dating from Aztec times. It is the juice of the maguey or century plant, which is largely cultivated, and a healthy drink although, if taken to excess, highly intoxicating. In the president's family, as in many others, the two principal meals of the day are almost the only occasions when all the members meet.

The desayuno, consisting of a small cup of chocolate or black coffee, with a roll of white bread or sweet cakes, and followed by a glass of milk, is served from 7 to 9 a. m., and every one partakes at his or her own convenience. About 12 or 12:30 o'clock breakfast, consisting of soup, fried rice, frijoles and usually nine other courses, are served, and at 8 or 9 p. m. the dinner, that is a repetition of the above. At both these

meals wine is the usual beverage.

In his family circle and among his friends President Diaz is most amiable and courteous, but in his public life and toward his officials he is firm and relentless, so much so that the title of president is almost obscured by that of military dictator. He is a man who neither drinks nor smokes, and whose whole time is devoted to the discharge of his official duties, a few days of hunting in the mountains being the only relaxation he allows himself.

He takes the greatest interest in the development and progress of Mexico, and every facility is given to strangers by him for carrying out any new enterprise. Some idea of his feeling toward the people may be formed from what took place at the reception held in the *Palacio Nacional* on the occasion of his last birthday. Upon the platform in the hall of the ambassadors, surrounded by his generals and officials, he had been engaged all the morning in receiving congratulations from the diplomatic body, from the members of the government and of the army. Although necessarily fatigued, the evening was devoted to the reception of the people and of those who were prevented from attending in the morning. The first to be received was a deputation from Oaxaca, the state in which the president was born and in which his earlier days had been spent.

The meeting between the president and his old compatriots and companions was touching. There was to be seen the absence of dignity of power and in its place signs of real affection. The old friend and companion, rather than the president, was there. The deputation was followed by a vast crowd of the pueblo of the city, for each of whom he had a kind word and a warm handshake. Among these was a poor old Indian, who had come with difficulty, bent down with age and infirmity. As he drew near the president descended and helped him on to the platform, and after talking with him for a few moments led him across to the place of exit. This was all done in a perfectly simple and natural manner, showing the kind and sympathetic nature of the man.

During a certain part of the year the president inhabits one of the houses in the *Calle Cadinan*, in the heart of the city, and in no wise different from the others. During the summer months he and his family take up their residence at the old historic residence of Chapultepec, at one time the burying-place of the Aztec kings. The castle is built upon a lofty rock, and with its buildings, its terraces and its observatory commands the admiration of the visitor. Approach to the castle is through a fine stone archway, on the one side of which is the guard house and on the other

the officers' room, leading into an extensive and well-laid-out park and flower garden. The grounds are of many acres in extent and kept in excellent order.

Adjoining the castle is the military school from which the army receives its officers. Although living at Chapultepec, it must be remembered that he spends each day in the city in his rooms at the Palacio Nacional transacting the business of the nation. He is always at his post, hard at work, yet ready to receive the stranger who would pay his respects to him. The plaza where the Palacio Nacional is situated abounds in historic members. Where the building now stands was at one time the site of the palace of the Emperor Montezuma. And facing it the old cathedral of Mexico rears its mighty pile on the site where the Aztec temple was built.

The cathedral must be approached closely if one would form any idea of it. It has been considerably dwarfed through the sinking of its walls and towers into the earth, it being, like the rest of the city, built upon a marsh. It is in the renaissance style of architecture and is 400 feet long, 200 feet wide, and its towers, from which a splendid view of the country round about can be had, are about 250 feet high. At the north side of the Palacio Nacional is the Calle S. Teresa, in which is the postoffice, and a little further down the nacional museum. In this building are preserved relics of Aztec times, demonstrating the high state of civilization attained by the Aztecs, and also the zeal that animated them in the worship of their many gods. In the museum the first thing that catches the eye is the famous Aztec calendar, one immense circular stone elaborately carved. Farther on is the famous sacrificial stone, three feet high and nine feet in diameter, upon which thousands of victims have been sacrificed. It is also one mass of carving, the subjects being warriors leading away prisoners.

Not far from the cathedral is the Church of S. Domingo, famous for being the church of the inquisition in Mexico. The school of medicine is built on the site of the court and dungeons of the inquisition. The garrote used by the inquisition is yet to be seen in the museum. To the president is due the bringing together of all those things bearing upon the history of Mexico. He has been accused of persecuting the church. This is, however, incorrect. The law of reform was passed anterior to the coming into power of Diaz. By this law the property of the religious orders and of the churches was confiscated and the buildings nationalized. Liberal as Diaz is, he dare not go against the law, especially as he is surrounded by those who have grown rich by church plunder and rank as the "parvenues" of the country.

### A Conductor Who Defended his Money.

Tom Robinson is a thick-set freight conductor on a run that takes him through the verdant New Jersey meadows, and accords him the distinction of living in the lively regions where Jersey City ends and Hoboken begins. Tom is something of a joker, and says his home is the liveliest place on the mainland, for there are swarms of mosquitos of the Jersey breed about the house all the year round.

No man in the service is more attentive to rules than Tom, but the rule against going into saloons while off duty he has considered an infringement of his personal liberty. Not that he is a drinking man, but he had a habit of looking into the little saloon on the corner while on his way home and indulging in a glass of beer. This saloon was the resort principally of men of low degree, and Tom was considered the most aristocratic patron. The habitués of the place naturally envied Tom, and coveted the wealth a railroad conductor must necessarily possess.

One night, as Tom was crossing some vacant lots between the saloon and his mansion, two enterprising voters of the region jumped upon him and demanded that he empty his pockets into their hands. Instead of doing that he smote them from head to heel with all the weapons that nature had provided. After a violent conflict a well directed blow from a cudgel laid him low, and the ruffians were victors.

They carefully examined the pockets of the prostrate conductor, and all they found was a dime and two cents. They were the most disgusted brace of ruffians in Jersey. They had received about \$10 worth of blows and gathered in only a few cents. "Be Jases," groaned one of them as he limped sadly away, "if the fellow had had a dollar in his pocket he wud av kilt us both."—*Locomotive Engineering.*

The *Ironmonger* holds that there should be in every county, a combination against the articles produced by the prison-labor contract system and sold in competition with the products of free labor. We heartily indorse all this. It has been our contention for years that prison labor should not be brought into competition with free labor. The tendency of doing this is to fill the prisons, which, we think, has been rather clearly shown in some parts of the country.—*American Machinist.*

### By All Means.

Hazel—"Sandstone has asked me to lend him \$5, and I don't know whether to do it or not. Would you?"

Nutte (earnestly)—"I would, old man. He invited me to dine with him this evening."—*Life.*

### The Use of Glass.

Since the days when Pliny's fabled Phœnician mariners were supposed to have discovered the art of making glass by burning seaweed on the sandy shore the art of glass-making has made enormous strides. But the Phœnicians were not the discoverers. The Egyptians knew about glass long before them, as is proved not alone by many pictures of glass blowers on the old tombs and monuments, but by the discovery of the article itself in many forms in excavations at Egypt, Ninevah, Troy and Alexandria. The arts of cutting, grinding, gilding and coloring glass were practiced 370 years before Christ. Pieces in the forms of lenses, vases and bottles have been found in Rome, Pompeii and Herculaneum, but no windows. The first glass windows in England were introduced by the Abbott Benedict A. D. 674. The Venetian glassmakers and glass-blowers were celebrated in the thirteenth century as they are celebrated to-day.

The manufacture of glass was one of the earliest industries in this country, and to-day the glass manufacturers—especially the mirror manufacturers—stand among the foremost and best in the world. The first factory spoken of was at Salem, Mass., and was the property of one Ananias Conklin, the position of his factory is even now known as Glasshouse Field. In 1746 there was a factory at Jamestown, Va., and in 1750 there was another at Germantown, Mass. But the first of which any real history exists was organized by Robert Hewes of Boston at Temple, N. H., 1790.

To begin to enumerate the uses to which glass is put one would have to enumerate every trade, every kind of building, every walk and employment in life, every step in life from the baby's bottle to the glass covered wreath upon the grave, every science and scientific experiment; there is not a single movement in the life of man or woman, that does not include the employment of glass. The great firm of Siemens Bros., of Berlin, have for many years been trying to produce a glass that shall be strong enough and flexible enough to act for railroad sleepers, ties and wheels.

Some slight idea of the vastness of the amount of glass used for windows, says the *Recorder*, and mirrors, may be obtained when it is stated that for several years past the sum of money annually paid in premiums for insurance has reached close upon \$700,000, a sum representing glass to the actual value \$25,000,000. Nor does this by any means include the whole of the glass thus used, for assuredly there are many people who do not insure at all and some who only do so partially. In a large hotel now building in New York city there will be 3,000 sashes, each about four feet square, without counting the large windows on the

ground floor. A still better idea of the quantity of glass used throughout the United States may be obtained from the estimate that during the coming year there will be manufactured and imported some 89,500,000 square feet of plate mirror and sheet glass. In detail 12,000,000 square feet of plate, 40,000,000 square feet of window or sheet glass, 4,000,000 square feet of mirrors and 5,000,000 square feet of colored, ceiling, floor and roofing glass. This is all to be manufactured in the United States. Then there are orders in hand abroad for importation into America amounting to 3,500,000 square feet of mirror glass, 25,000,000 square feet of window glass and 800,000 square feet of colored, ceiling, flooring and roofing glass.

### FRATERNITY.

What though the crowds who shout the word,  
Pervert the meaning it should bear,  
And feel their heart with hatred stirred  
Even while their plaudits fill the air:  
Yet shall not we thou mighty Thought,  
Despair thy triumph yet to see,  
Or doubt the good that shall be wrought  
In thy great name, Fraternity.

By prophets told, by palmists sung,  
Preached on the Mount by lips sublime,  
The theme of every sage's tongue  
For twice a thousand years of time;  
What happy progress hast thou made?  
What bliss to man hath flowed from thee?  
What war and bloodshed hast thou stayed?  
What peace affirmed, Fraternity?

Alas! the years have failed to teach  
The obvious lesson to mankind,  
And myriad preachers fail to preach  
Conviction to the deaf and blind.  
Still do we rush to furious war,  
Still to the slayer bend the knee,  
And still, most Christian as we are,  
Forget thy name, Fraternity.

And shall we, cramm'd with mutual hates,  
Dispute our neighbor for a flaw,  
And sneer, because he promulgates  
Before he understands the law?  
No! let us hail the word of might,  
Breathed by a nation of the free:  
Thy recognition is a light—  
Thy name a faith, Fraternity.

The preacher may belie his creed,  
But still the truth preserves its flame;  
The sage may do a foolish deed,  
Yet wisdom shares not in the shame.  
Be scornful hushed—be cavil dumb—  
Whatever fills the world may see,  
We'll look for blessings yet to come  
In thy great name, Fraternity.

—Charles Mackey.

THE following table shows the comparative cost of a number of leading articles consumed in the United States:

Liquors . . . . .	\$900,000,000
Tobacco . . . . .	600,000,000
Bread . . . . .	505,000,000
Meat . . . . .	803,000,000
Iron and Steel . . . . .	296,000,000
Woolen goods . . . . .	237,000,000
Sawed lumber . . . . .	233,000,000
Cotton goods . . . . .	233,000,000
Boots and shoes . . . . .	197,000,000
Sugar and molasses . . . . .	155,000,000
Public education . . . . .	96,000,000
Clergymen's salaries . . . . .	12,000,000
Christian missions, home and foreign . . . . .	5,500,000

**HELP ONE ANOTHER.**

"Help one another," the snowflakes said,  
As they cuddled down in their fleecy bed,  
"One of us here would not be felt,  
One of us here would quickly melt!  
But I'll help you, and you help me,  
And then what a big white drift we'll see."

"Help one another," the maple spray  
Said to his fellow leaves one day;  
"The sun would wither me here alone,  
Long ere the day is gone;  
But I'll help you, and you help me,  
And then what a splendid shade there'll be."

"Help one another," the dew drop cried,  
Seeing another drop, close by its side;  
"This warm south wind would blow me away,  
And I should be gone ere noon to-day;  
But I'll help you, and you help me,  
And we'll make a brook and run to the sea."

"Help one another," a grain of sand  
Said to another grain just at hand;  
"The wind may carry me over the sea,  
And then, oh, what will become of me?  
But come, my brother, give me your hand,  
We'll build a mountain and there we'll stand."

And so the snowflakes grow to drifts,  
And grains of sand to mountains;  
And leaves become a pleasant shade,  
And dew drops feed the fountains.

**Advice for Fat Folks.**

Professor Schweninger, Bismarck's protegee and physician, says to fat people who want to reduce their obesity: Man lives not on what he eats and drinks, but on what he digests and consumes, and according to the way in which he digests and consumes it. As for the chemical elements of food, it is very interesting to know them; but, seeing that they usually occur in various combinations, there is little help to be expected from the physiology of foods. For practical purposes the professor divides the nourishment of his patient into three parts—the staple food, which may amount to two thirds, three-fourths, and four-fifths of the entire nourishment consumed each day; subsidiary aliments and drinks.

Hunger and thirst have no place in Dr. Schweninger's method. Hunger, he admits, offers a short cut to leanness, but it does not contribute to improve the quality of the blood or to strengthen the muscles and the heart, and any treatment that is to benefit the corpulent must do all these things, besides reducing weight and bulk. Neither does the professor prescribe an apothecary's scales with which to weigh and dole out the morsels of meat, vegetables, or bread. On the contrary, within reasonable limits, his patients may eat and drink as much as they like, provided that they confine themselves to the kinds of food which he permits, that they eat little at once, though oftener than usual, and allow a certain time to elapse between eating and drinking. The reasons given for this prescription are as follows: Suppose a corpulent man consumes daily a quantity of food represented by ten and takes two meals daily, and suppose further that his

weight is increasing in consequence. It is possible to arrest this increase of weight, and even to lessen it without diminishing the quantity of food he consumes, provided that instead of dividing it into two meals he divides it into four or five. Heavy meals promote the formation of fat; light repasts have the contrary effect. It is needless to fix the quantity that may be eaten with impunity at these light and frequent meals, because the patient must act on the principle that repasts may easily be too heavy, but can never be too light.

The reason why drinking should not accompany eating, but he indulged in before or afterward, is, in the first place, because liquids are foods as well as solids, and repasts must be kept as light as possible at all costs. But there is another reason. Dry repasts, if light, lead to a loss of flesh, whereas the same quantity of food, if it include liquids, is devoid of this effect. It is not easy to say why this should be so, but the most probable explanation is that when only solids are eaten the juices of the body are called into action to a larger extent than otherwise, in order to further the process of digestion, whence a sensation of thirst is usually experienced. The body has thus lost more than the ordinary quantity of water, and if this loss be not compensated by drinking it will be replaced by the body itself, which will draw upon its superfluous fat for the purpose. The fat is decomposed into its elements, and combustion takes place. This process commences about an hour after eating, and if drinking be deferred until then it may be indulged in afterward with profit, inasmuch as it promotes the very process which, half an hour earlier, it would have prevented. But in any case and at all times during the cure liquids must be taken with as much moderation as solids.

Turning now to the question of diet, Professor Schweninger allows his patients to compose their menu from the following goods: 1. Staple nourishment—Every species of fresh meat cooked in every conceivable manner and served hot or cold, fat or lean; fish, oysters, caviare, crabs, lobsters, sausages, eggs, cheese, etc. 2. Subsidiary food—Bread, fruit, spinach, asparagus, cabbages, sauerkraut, cucumbers, green salad. 3. Drinks—Water, soda water, acidulated mineral waters, fruit juices, lemon juice, white wine and cider.

Alcohols are to be avoided, so are also soups, potatoes, turnips, nuts, macaroni, rice, pastry, and butter and lard (except in so far as they are needed in order to cook the meat and vegetables), and not only alcoholic drinks, but also tea, coffee, chocolate, cocoa and milk.

The professor dolefully complains of the indignation often manifested by his stout

female patients on hearing sentence pronounced against tea, coffee, milk and chocolate. "Milk, cocoa, and chocolate are banished already," they murmur; "if I have, in addition, to give up my tea and coffee, what else is there for me to take at my first breakfast in the morning?" To this Dr. Schweninger has one stereotyped reply. Tea and coffee have been struck out for the express purpose of radically changing the form of the first breakfast, which should be a "compact meal," consisting of meat, fish, eggs, cheese, or some other similar nutritious food.—*London Telegraph.*

### The Rights of Railroad Employees.

The rights of the employees of railroads that are in the hands of receivers have been passed upon by the courts lately in several notable instances, but the decisions lack that uniformity which is desirable where the interests involved are so important. There are now about 32,000 miles of railroad, representing \$4,000,000,000 of capital, which are being operated under judicial supervision and direction, with the probability that other lines will be forced into the same unfortunate state during the present year. It is very desirable, therefore, that the legal rights and duties of the men who are thus practically placed in the service of the government shall be defined by the proper tribunals in such a way as to avoid confusion and prevent mischief. There is a difference, of course, between the positions of men who are working for a railroad company under ordinary conditions, and those who are doing like work when the property is in charge of receivers. As to what extent this difference affects their privileges and obligations, there may easily be a contrariety of opinion; and it is for the courts to settle the matter according to those rules of justice and equity which have the same meaning and application in all parts of the country. This should not be difficult for judges have the same laws to construe and the same circumstances to deal with, practically speaking; and it is to be hoped that they will agree upon some general plan of action, instead of pulling at cross purposes as they are now doing.

It is unquestionably true, as Judge Caldwell says, that the employees on a road in the hands of a receiver are the employees of the court, in the same sense that the receiver is, and, therefore, as much entitled to be heard upon any issue affecting their interests. In the case of a proposed reduction of wages, they should have opportunity to show that such reduction is unnecessary or improper; and when the reduction is made in spite of their protest, for reasons satisfactory to the court, they should certainly have the privilege of refusing to work at the prices thus fixed. The idea that a man may

be forced to render service on terms that do not suit him is repugnant to the spirit of our institutions, and can hardly be popularized by judicial scantion and enforcement in any contingency. But it is manifestly true at the same time that the employees of a railroad, particularly one that is in the custody of the government, should not be allowed to paralyze or obstruct its operation on any account or in any manner. They can quit its service at their pleasure, when they do not thereby violate an express contract; but, having taken such a step, it is clearly wrong for them to interfere with the property or the functions of the road. If they want to strike, in other words, they may legally do so, to the extent of severing their relations with the road and seeking employment elsewhere; but they must not use their power as individuals or in an organized capacity to prevent other men from taking their places, or to stop the moving of trains by any sort of violence. The courts should find it easy to agree upon these points and to compel the faithful observance of rules established to meet all of the necessities of the situation; and that kind of action is imperatively demanded of them in the interest of all concerned.—*St. Louis Globe Democrat.*

### Hard to Make a Lion Lie Down with a Lamb.

"The hardest thing to train a wild beast to do is to perform with a weak, defenseless animal," remarked A. L. Hutchins, an old circus and menagerie hand, who has deserted the arena and ring for mercantile pursuits. "I remember once several years ago an effort being made to persuade a very docile lion to lie down with a lamb. The idea was certainly a good one, but it took several lambs and also several weeks before the lion, which was willing to jump through a burning hoop, sham death on being shot, etc., could be persuaded to allow a lamb to enter his den with impunity. Twice he killed a lamb in the presence of his trainer, and the second time he nearly killed the trainer, who rather recklessly tried to get away the carcass. Finally the lion would tolerate a lamb in its den just as long as the keeper stood over it with an iron bar. But the effort was so evidently forced and the performance was so utterly lacking in smoothness and interest that it was abandoned after two or three attempts."—*St. Louis Globe-Democrat.*

### She Was Not Poetic.

It was in the far west.

"Darling!" he whispered. "After I left you last evening I walked on air!"

She met his words with a look of wonder and maze.

"Well, I declare!" she exclaimed. "Who cut you down, Hank?"—*Town Topics.*

**NO SHOW.**

Joe Beal 'ud set upon a keg  
 Down to the groc'ry store, an' throw  
 One leg right over 'tother leg,  
 An' swear he'd never had no show:  
 "Oh, no," said Joe,  
 "Hain't hed no show"—  
 Then shift his quid to 'tother jaw.  
 An' chaw, an' chaw, an' chaw, an' chaw.

He said he got no start in life,  
 Didn't git no money from his dad,  
 The washin' took in by his wife  
 Earned all the funds he ever had;  
 "Oh, no," said Joe,  
 "Hain't hed no show"—  
 An' then he'd look up at the clock,  
 An' talk, an' talk, an' talk, an' talk.

"I've waited twenty year—le's see—  
 Yes, twenty-four, an' never struck,  
 Altho' I've sot roun' patiently,  
 The fust tarnashion streak er luck,  
 "Oh, no," said Joe,  
 "Hain't hed no show"—  
 Then stuck like mucilage to the spot,  
 An' sot, an' sot, an' sot, an' sot.

"I've come down regerler ever' day  
 For twenty years to Piper's store;  
 I've sot here in a patient way,  
 Say, hain't I, Piper?" Piper swore,  
 "I tell ye, Joe,

Yer hain't no show,  
 Yer too dern' patient"—the hull raft  
 Jest laffed, an' laffed, an' laffed, an' laffed.

—S. W. Foss in *Yankee Blade*.

**A Boy Revolutionary Hero.**

Of the boy heroes of the Revolution the first and almost forgotten one was Nathan Benam. In the spring of 1775 he lived with his father, a farmer, near the village of Shoreham, which was opposite Fort Ticonderoga. Farmer Beman was an American devoted to the cause. Being of a roving disposition, and fond of play, Nathan had often crossed the lake and formed the acquaintance of the boys whose fathers composed the garrison. The little fellows had fine times under the walls of the fort, and every now and then Nathan went inside and saw how things were moving along there. In the month of May, Ethan Allen, at the head of the famous Green Mountain boys, came up through the forests to surprise and capture, if possible, the fort and its garrison. The expedition with which Benedict Arnold was connected, was composed of three divisions, one of which was to capture some boats at Skenesborough and send them down the lake to Allen and his men, who were to get them at Shoreham. But when the renowned Green Mountain leader reached the latter village, in the night time, not a single boat awaited him. This was a bitter disappointment, for Allen had but eighty-three men with him and his position was one of great hazard. It looked like madness to assail with his small force an armed place like Ticonderoga, yet it was still more dangerous to remain idle.

"We can't wait for the boats, my boys!" exclaimed the intrepid Allen. "We must assault the fortress."

In looking for a guide the Vermonter

found Farmer Beman, who, as soon as he understood what was wanted, said:

"Why not take my boy? Nathan knows all about the fort. He's been all over it, and knows the location of every rat-hole inside and out."

The suggestion delighted Allen, and little Nathan was called and questioned.

"I'll go, sir," he said, at once. "I know the way to Delaplace's quarters, too, if you should want to find him."

Delaplace was the commandant and, of course, the very person whom Allen wanted. The little party crossed the lake in such boats as they had at hand, oars were dipped silently in the starlit water, and no one spoke above a whisper. Morning was near at hand, and so much precious time had been lost that every moment had to be put to use. When the patriots reached the opposite shore the commander turned to Nathan Beman, and laying his hand upon his shoulder, said quickly:

"We're ready now. Show us the way to the sally port."

Guided by the farmer's son, the mountaineers moved toward the fort, and, coming suddenly upon a sentry, heard the snapping of the fusee lock and saw him run through a covered way within the walls.

"Quick!" cried the boy, looking up at Allen, and the soldiers sprang after the guard and made their way to the parade ground unopposed. The enthusiasm of the patriots now broke forth into shouts of victory which, reaching the ears of the British soldiers, caused them to spring from their pallets and rush from their barracks, only to be made prisoners as they appeared. Never was a surprise more complete—thanks to Nathan Beman. When Allen had secured most of the garrison he asked the boy to show the way to the commander's room, and the two were soon running up the steps leading to it.

Bang! bang! went Allen's sword against the colonel's door, and the British officer hurried out of bed to answer the demand. It happened that Allen and Delaplace were old acquaintances, and the reader can imagine the latter's astonishment when he saw who was hammering at the door. Of course there was nothing for him to do but to surrender. The spoils that fell into the hands of the victors amply repaid them for all the dangers they had faced, and the fort remained in the hands of the Americans for many months later, when it was abandoned and dismantled by Gen. St. Clair. Amid the general rejoicings that followed this exploit the part played by Nathan Beman was not forgotten. His name was on many tongues and his services were embalmed in the poetry of the day. Without him Allen's heroic expedition would in all probability have resulted in failure.

Nathan grew to manhood and ended his days in peace in the year 1856, dying then in Franklin county, New York, at the age of 89 years. "He lived," says Lossing, the historian, "to see our confederacy increase from thirteen to thirty stars, and from 3,000,000 of people 20,000,000."—*The Advance*.

### Ingersoll's Star-Route Story.

Col. Robert G. Ingersoll has another fad besides Shakspeare, and that is story telling. When he was here last Wednesday he indulged it to quite an extent, and among the stories that he told was one about the way that luck befriended him in one of the famous star-route trials, in which he took such a prominent part. "I had a jury," said he, "on which there were four negroes. The testimony was against me, and when it came to time for summing up I was confident that I should be beaten out of my boots. I went at it, however, and talked something like a week. I believe my speech was over five days in length. I knew that I would have to gain the affection of my jury and I picked out the four negroes as the most likely subjects. On the second or third afternoon of my speech I happened to mention John Brown, and I noticed that one of the jury men looked interested. I had just as soon talk about John Brown as anybody else, and I don't know but that I had rather eulogize him than anybody else in American history. So I reviewed all the circumstances attending his raid and his life and dwelt on his bravery and things of that sort for an entire afternoon. I guess I must have talked for five hours about him. When I had finished him up I was sure that I had captured one man on that jury anyway. I talked long and finally finished and the jury went out. It disagreed and I practically won.

"I learned in a day or two that I had five men on the jury who stood out for me and who made the disagreement. They were the four negroes and one of the white men. I was sitting in my office one day not long after when the door opened and the jurymen who had been so deeply interested in John Brown came in 'Mistah Ingersoll,' he said, 'I thought I would come around and tell you how powerful glad I was to hear you talk that way about John Brown. After that, sah, I would have stuck to you if I had to stay in that jury room until I died, sah.' I asked him why he was so interested in John Brown, and he said, 'Well, sah, I don't tell many people, but I'll tell you. I was one of the men who was with John Brown on that raid, sah.'

"The next day my office man, who was a negro, came to me and said: 'I'ee powerful glad you won, Cunnel, powerful glad. I helped you, sah. I asked him how on earth he helped me, and he said. 'My father was

on the jury, sah, an' I says to him, 'We must stick to the Cunnel,' an he says to me. 'Oh, yes, we must stick to the Cunnel,' and he did, sah, he did.'

"There, you see, were two cases of luck, if I hadn't spoken of John Brown, and had not had a negro porter with a father, I might have been defeated. These two negroes influenced the other two, and the white man stuck to me through some other influence which I have not been able to locate."—*Buffalo Express*.

### Reinard Mannesman.

Mr. Reinard Mannesman, Sr., of Remscheid, Germany, who died recently was perhaps best known to the younger generation of mechanics in this country through his connection with the Mannesman process of rolling tubes, but there are many other interesting things connected with his life and achievements, he having done very much towards the modern building up of Germany's manufacturing industries, and at the same time basing his efforts upon the very best motives which influence men in making progress.

Mr. Mannesman's father owned an old-fashioned steel works which when his son took its management was improved and made famous, the subject of this sketch finally making his files as well and as favorably known upon the continent of Europe as the best English files.

Socially and politically, also, he was prominent, and the very high regard in which he was held by his workmen is shown by the fact that during the great strike in 1873 he was selected by them as their representative, although from the narrow point of view, his interests as a manufacturer were against those whom he was thus chosen to represent. Mr. Mannesman was in his 80th year when he died, and leaves six sons who are technically trained in the same line as that pursued by him.

The difference in spirit manifested by engineers and scientists, on the one hand, and by politicians on the other, was shown in connection with Mr. Mannesman's exhibit of files at Paris in 1867. The files were awarded gold medals, and it was proposed to give him the *croix d'honneur*, but Napoleon III. declined to grant this distinction, writing upon the margin of the jury's report, "To a Prussian, never!"—*American Machinist*.

LAKE TITICACA, the highest navigable water in the world, 13,000 feet above sea level, has had a steamship of 500 tons launched upon it. The vessel was built on the Clyde, and the transportation doubtless involved many difficulties.—*The Engineer*.

**HIGH LIFE IN CHICAGO.**

Last night dear Mrs. Bacon-Rhynde,  
Of Prairie avenue,  
Got up a fete to celebrate  
Her daughter Maude's dayboo.  
The lavishness of wealth displayed  
Would turn a Croesus pale,  
And best of all was Bacon-Rhynde  
In his first swallertail.

A hundred splendid carriages  
Drove thither through the mud,  
With the alcey who came to greet  
The latest social bud.  
In fact, the city all was there,  
Excepting the canail.  
And 'mongst them all strode Bacon-Rhynde  
In his first swallertail.

His doeskin vest was decoltey,  
As all such vests should be,  
And frills galore his bosom wore,  
A gorgeous sight to see;  
Four diamonds that for a king  
As ransom would avail,  
Shone in his shirt when Bacon-Rhynde  
Wore his first swallertail.

His collar high its fence upreared  
About his ruddy neck;  
His long cuffs shone with perfect tone  
And innocent of fleck.  
His trousers! When I speak of them  
My powers begin to fall,  
For they were white when Bacon-Rhynde  
Wore his first swallertail.

French counts were there and English lords,  
And real Eytalian looks,  
And native pets whom cigarettes  
Had made as pale as spoeks.  
Great men were there whose bank accounts  
No crisis could assail,  
But Bacon-Rhynde outdid them all  
In his first swallertail.

I can't forget that swarry held  
On Prairie avenue;  
Though 'twas by right his daughter's night,  
'Twas Bacon-Rhynde's dayboo,  
A Chinese junk of fashion be,  
Full-rigged and under sail—  
Chicago's great Akhoond of Swat,  
In his first swallertail!

—New York Sun.

**Elephant Meat for Food.**

All African explorers speak highly of elephant steaks. The full-grown elephant weighs about 7,000 pounds, and Mr. Newbury estimates that he can count on some 3,000 pounds of first class meat from each animal. In twenty-five years he expects to see elephant meat for sale in all markets.

Steaks as big as bed mattresses will hang up on all sides and French elephant chops with handles on them six feet long will lie on the counters. Elephant hides, he thinks, will be found valuable for leather, slightly thick, perhaps, but it can be split. Then there is the ivory, always in good demand. The clip of wool from an elephant will, of course, he admits, be small, but there were formerly woolly animals of the elephant kind, and he does not see why careful breeding may not revive the species. Fine all California elephant's wool clothing he considers a possibility of the future. But it is not alone in these ways that Mr. Newbury expects to be able to teach California

to profit from the elephant. It is a powerful and intelligent animal, and as a beast of burden will be as successful in California as in India. It can be readily broken to harness, and can draw enormous loads. Nor does he despair altogether of the elephant as a driving animal.

He thinks it not unlikely that the California trotting elephant may be evolved, as the American trotting horse has been. Cabmen may yet call out: "Keh, sir keh! Nice closed keb and rapid elephant!" Of course, as a saddle beast the elephant has proved his superiority in the Orient. Its gait, however, is at present irregular, but Mr. Newbury sees no reason why it may not be taught a graceful canter and a swinging gallop. But the most practical place where the elephant can be put to immediate usefulness Mr. Newbury considers to be the orange groves.

"In picking oranges," says Mr. Newbury, "the trained elephant would be a great success. He would come as a boon to orange growers. He could readily reach all over the trees with his trunk and carefully pick the fruit and place it in a bag on his back; he could pick more oranges than ten men, and would never strike for higher wages or flirt with the hired girl. If I were asked to name in three words the hope of California for the future I should answer: 'Elephants, elephants, elephants.'"—*California Times-Mirror*.

**How the Apostles Died.**

St. John died a natural death.

St. Matthew was killed with a halbert.

Judas "fell and his bowels gushed out."

St. Barnabas was stoned to death by Jews.

Paul was beheaded by command of Nero.

St. Luke was hanged on an olive tree in Greece.

St. Philip was bound and hanged against a pillar.

St. Simon was crucified after the manner of Jesus.

Andrew was bound on a cross, and left to die from exhaustion.

St. James the Great was beheaded by order of Herod at Jerusalem.

St. Bartholomew was flayed to death by command of a barbarous king.

St. Mark was dragged through the streets of Alexandria until he expired.

St. James the Less was thrown from a high pinnacle, then stoned, and finally killed with a fuller's club.

Peter was crucified in Rome, with his head down, on a cross similar to that used in the execution of Jesus.

St. Thomas was shot by a shower of arrows while at prayer, and afterward run through the body with a lance.—*St. Louis Republic*.

### Faces and Callings.

It appears probable that the tailor's distinctive type of face may have been partially created by his habit of working his jaws concomitantly with his shears. Let any one watch a person cutting a piece of tough material with scissors and he will see that the lower part of the face wags in rhythmic and spontaneous unison with the blades. Shepherds and farm laborers who join sheep-shearing gangs certainly acquire a different expression while engaged in this kind of work.

The cast of countenance by which one so easily recognizes a groom is partially explicable from the fact that the muscles which close the jaw and compress the lips are always called into play when we are asserting our will over that of a horse. Nearly all jockeys and other horsey men have a peculiar set of the mouth and chin, but I have been unable to distinguish any special characteristic about the eye or upper part of the face.

It is instructive to compare the visage of the ruler of horses with that of the ruler of men. The horseman's face shows command in the mouth, the drill sergeant's in the mouth and the eye. The last is undoubtedly the most effective instrument in exacting obedience from our own species. Here we get a hint of the cause of that want of dignity, that element of coarseness which is discernible in the countenance of some men and women who have much to do with horses. The higher and nobler method of expressing authority is outwighed by the lower and more animal one—*Blackwood's Magazine*

### A Sample Steal.

One is strongly reminded of the old saying regarding the falling out of rogues by some recent occurrences in connection with the financial management of the Northern Pacific Railroad, illustrating again the fact that much that is nowadays called "business" and "financiering" is really swindling, if not stealing.

In this contest for control of the affairs of the road named, it has been shown by the testimony of the engineer in charge of the work, corroborated by the cashier and book-keeper, that the actual cost of a terminal in Chicago was something less than \$8,000,000, though in bonds and assumed indebtedness the cost to stockholders, and eventually, of course, to the public, was made \$20,000,000, leaving \$12,000,000 entirely unaccounted for.

As a result of this piece of "financiering" a number of "very prominent men," "substantial citizens," etc., have found it desirable, not to say highly important, that they should leave the country; which they have done, with aliases instead of their proper

names appearing upon the passenger lists of the steamers by which they sailed.

The whole thing is a disgrace not only to the rascals engaged in the transaction but to American railway management generally, and it cannot be denied that such accidental exposures (making it plain that there is much more not exposed to the light), do more than all other influences combined to produce dissatisfaction among the masses of the people; which is apt to be manifested in ill advised legislation or in worse ways.

What an encouraging thing it is, for instance, for a machinist working in a railroad shop or for the head of a department in such a shop to reflect that economies and improvements made by him as a result of a life's study and hard work, are a million times over swallowed up by a few weeks or days scheming of officers intrusted with management and control, assisted by lawyers to steer them clear of penitentiaries.

We do not for one moment think that an honest mechanic has the least reason to envy such precious rascals; quite the contrary, but this does not prevent his feeling dissatisfied with the relative rewards of honest, faithful service on the one hand, and of downright thieving on the other.

In all seriousness we declare our belief that such men as have been concerned in this Northern Pacific steal, and that are elsewhere carrying on similar operations, are infinitely more powerful factors in breeding discontent and disregard of law than all the sincere but misguided Coxseys that some of us have persuaded ourselves to believe dangerous to society.—*American Machinist*.

THE amazing growth and value of the cotton-seed oil industry is well shown by the following facts. In 1880 there were forty cotton-seed mills, with an aggregate capital of \$3,500,000. There are now 300 mills having a combined capital of about \$30,000,000. At present about 1,500,000 tons of seed are annually used by the mills, yielding to the farmers about \$18,000,000 a year for a product which until recently was regarded as waste material. The total output is about 1,500,000 barrels or 60,000,000 gallons of oil, 500,000 tons of cotton-seed meal, 750,000 tons of hulls, and 30,000,000 pounds of linters, the aggregate value of which will average about \$30,000,000.—*The Engineer*.

### Naturally.

Haverly—"There is only one drawback to women practicing medicine. They always devote themselves instinctively to one specialty."

Austin—"What specialty is that?"

Haverly—"Heart trouble."—*New York World*.

**SICK TRANSIT.**

This is the state of man: today he puts forth  
 The tender roots of habit: tomorrow blossoms  
 Of the same, and keeps on blossoming  
 And taking deeper root, until at last  
 It takes more work to move him from his corner  
 Than it does to stir a house dog from the rug  
 Before the fire.  
 Then—when he thinks, good easy man,  
 His ways are settled for all time—  
 Some busy woman comes along and says:  
 "Please move about six inches till I run  
 The sweeper o'er the place your chair has been."  
 An lo, he splits the air with lamentations,  
 Loud, and deep, and shrill:  
 He cries, there is no rest this side of Paradise  
 For a poor man, weary and worn from moving round  
 Out of the way of sweepers,  
 And wishes he were dead.  
 O, how wretched is that poor man who cannot sit  
 In last year's dust and grime until this year  
 Shall be two years ago last year!  
 And when he dies, his hope and comfort is,  
 He will be laid in dirt, never to move again.

—Robert J. Burdette, in *Ladies Home Journal*.

**Growth of Paternalism in Our Midst.**

Recent amendments of the constitution have also considerably altered the original character of that document, and invariably increased federal power. But, above all dangerous to democracy is the growth of a vast army of officers, whose dependence on the central government compels them to be obedient and subservient to centralization. They can be counted on as men to place their allegiance to the powers exercising government above allegiance to principles. The possible limits of centralization from these directions may have been reached, for the Federal Election bill has startled the people into an indignant protest irrespective of parties. But Jefferson was not a mere opponent of a strongly centralized government at Washington. He wrote, "The tyranny of the legislatures is the most formidable dread at present, and will be for years."

Our state governments have, in many cases, become tyrannical, to a degree equal to that action of Parliament that led to our revolt. In several cases they have interfered with the collection of private debts; and have in all directions so overlaid statutes that simple equity has become impossible where not illegal. The question never was one essentially of the national government against state governments; but of government altogether against the liberty of the individual. Jefferson's jealousy was for the fundamental inherent rights of the individual. He opposed any assumption of power, anywhere, by any body of men, not strictly limited by compact; not fully and literally designated by the people as the official duty of such a delegated body. From congress down to boards of supervisors, we have abundant illustrations of the tendency of official bodies to magnify office, and forget that they are servants and not lords of the people.

But the danger to popular and individual

liberty seems more likely to suffer limitation and mutilation from another direction. Dazed by the fact that we, the people, are receiving the most perfect service from national post-offices; and that, in a few other directions, we are doing co-operatively what individually we could not so well do, a popular cry has arisen and gained great force in different organizations for an entire upset of the old system and a total surrender to nationalism. Legislation seems, to many, the final remedy for all ills. I have no space for anything like a reasonable discussion of this momentous danger. It is, perhaps, enough to call attention to the fact that the most outrageous assumption of unwarranted authority has occurred from that service of which we have been most reasonably proud, the post-office. Our public carriers have notified us, that if our social and theological views do not accord with the views of the man whom we select to be responsible for an honest mail service, our mails are closed against us. There is already a censorship of literature. Shall we have also in due time a censorship of the press and of the pulpit? This has been the invariable tendency of centralized authority.—*Arena*.

THE tailor-made girl has written out a few simple questions, and she hopes that some nice, good man will be kind enough to answer them. Here they are:

Why do coat-tails turn up until the scalloped edges remind one painfully of cold pancakes?

What reason can you give for the downright stubbornness of cuffs? They either will not show themselves at all or else they stretch out about six inches over your hands.

Is it an established fact that collar buttons, studs and cuff-links are invariably too small or too large for their respective button-holes?

When the stiff corners of your collar rise up fiercely and dig big holes in your chin what do you do about it?

Is it possible to tie a necktie neatly and correctly without losing your temper and twenty minutes valuable time?

If a shirt-bosom shows an inclination to assume the wavy appearance of a wash-board, is it wise to stamp your feet and yell?

Of what great benefit are ten pockets when you don't dare use any of them because they'll bulge out and spoil the shape of your coat?

Do collar-buttons always roll under the bureau? Don't they occasionally make a bee line for the stairway and turn hand-springs clear down to the parlor floor?

Don't you honestly think that those demi-trained coats are everlasting nuisances, anyway?

### Harnessing the Wind.

The Netherlands Society for the Promotion of Industry has offered a gold medal and \$150 for the best paper on the use of windmills and electric accumulators for supplying power to factories. The points especially to be considered are the average energy a common windmill can produce in conjunction with storage batteries, the installation most suitable, the cost per horse power per hour, and the economy of the system on a large scale.

In this country a fair measure of success has been attained in harnessing the wind to the performance of menial and domestic service. It has been made to pump water for stock, to grind feed, cut up ensilage and fodder, and in due time it will be employed to furnish electric light for farm residences and yards.

The *New York Press*, in a recent issue, said: "Mr. J. A. Corcoran, of Jersey City, has just completed a novel experiment in the application of a windmill to an electric lighting plant. The plant, though an experimental one, is now in operation without as yet a single mishap, and the storage cells furnish current for twenty-four incandescent lamps in Mr. Corcoran's residence. Everything points to the complete success of the scheme. The mill has a diameter of eighteen feet, and at a speed of twenty miles an hour is capable of delivering three-horse power. The dynamo, driven by belt from the main gear, charges a set of storage batteries. It is so designed that throughout the wide variations of speed of the windmill it maintains the potential constant. Mr. Corcoran says the application of a windmill to run the dynamos of an electric lighting plant will place electricity in the homes of thousands, who can thus secure their motive power from nature. A windmill is not a very costly structure, and any one who owns a bit of open land about his residence can erect one and fit up his simple electrical apparatus inside of it. The thousands of windmills one sees in traveling over the country, if Mr. Corcoran's scheme prove a permanent success, may be utilized for lighting the residences of the owners and those of their neighbors, as well as drawing water for stock. One windmill will light half a dozen residences at the same time. The machine in Mr. Corcoran's windmill occupies a floor space of only thirty inches square and fifteen inches high. The dynamo has a maximum current capacity of thirty-five amperes at thirty-five volts, and is put into action when the speed is 600 revolutions per minute: that is, when an eight-mile breeze is blowing."

In Iowa, it should be noted, the average velocity of wind is above eight miles per hour, especially on the elevated ridges.

By utilizing the waste forces of nature, by means of wind motors, dynamos, and storage batteries, we may in due time furnish our homes with light and heat. It is safe to predict that within the first quarter of the coming century vast progress will be made in that direction. The golden age of the world is the future, and not in the past.—*Iowa Weather Review*.

### Too Much Discipline.

"Talk about discipline," remarked Victor M. Harding in the Auditorium Hotel, "the quintessence of this essential quality is reached in Russia. While the Russian army has been defeated many times, it has never been stampeded. It has been driven from the field but never fell in a panic-stricken mob. This is attributable to no other reason than the firm government and strict obedience to orders. Count Kievlovsk once told me the story of a Russian soldier who was told to throw his gun aside and run down to the river and summon a superior officer. The soldier misunderstood the order, and running down to the shores of a rapid and deep stream, threw himself in. He could not swim a stroke but never thought of that. It was with the utmost difficulty that he was rescued. As it was he nearly died. When taken to task for jumping into almost certain death he only replied, 'Death don't count when orders are to be obeyed.' The funniest sight I witnessed in Russia was an incident of an army surgeon on his rounds. Entering the hospital ward the officer in charge gives the order, 'Attention,' and those who have at least one leg left stand up like soldiers. 'Tongues out,' is the next command, followed by the projection of all tongues. The surgeon walks down the line examining each tongue and giving directions for treatment. When all the inmates have been attended to and the surgeon leaves the room the order 'Tongues in' is given, followed by 'In place next,' which is the official permit to return to the cots."—*Chicago Herald*.

### Great Victory of American Railwaymen.

The strike on the Great Northern Railway of America has been declared at an end. The result was the outcome of a conference between the president of the railway company, the president of the Railway Union, and representatives of the commercial bodies of the cities of St. Paul and Minneapolis, the latter acting as judges. The company has conceded nearly everything that the men demanded. This is a heavy score for the new Railway Union, and the principle of amalgamation it represents, being in striking contrast to the miserable failures of the sectionalism hitherto so much in favour in the United States.—*London Railway Review*.

**LOVE'S FOREVER.**

"Then must we really part forever?"  
 Some rashly spoken word had chilled her,  
 And scornfully she turned away  
 From the soft speech whose potent sway  
 Had evening after evening thrilled her.  
 Responsive to the plaintive plea  
 That certified his heart's endeavor,  
 She glanced at him disdainfully.  
 And cold as rolls the Polar sea  
 Her voice pronounced the word "Forever!"  
 A sob! A moan! With leaden feet  
 From the veranda he descended,  
 Trod ruefully the murky street,  
 Praying to find a winding sheet,  
 And whatsoever with it blended.  
 "This woe must cease," he said, then laid  
 His hand upon a dagger straightway:  
 A gasp! a shudder! then the blade  
 Was pocketed and tracks were made  
 Back toward the cruel maiden's gateway.  
 A form rushed out, four arms did lock  
 As if they never meant to sever;  
 A simultaneous labial shock,  
 And twenty minutes by the clock  
 Had marked the bounds of Love's forever.

—Boston Courier.

**Slot Machines.**

Two young men entered the Lafayette cafe recently and ordered drinks, says the *Philadelphia Press*. While the barkeeper was preparing them one of the young men turned to a slot machine which advertised that it could tell anyone's age. He dropped a nickel in the slot, followed the instructions printed, and soon obtained a card on which were the figures, "20 years, 6 months, 19 days."

"By George, that's my age to the day!" he exclaimed.

The bartender looked up and said:

"Is that so? Are you really 20 years old?"

"Yee," replied the guileless youth.

"I am very sorry," continued the bartender, "but if that is so I can't sell you any drinks; you are a minor."

An elderly gentleman with a gray beard stood by with an amused smile while that was going on, and told the bartender that he was right. The elderly man proved to be J. W. Brooks, of New York, who is heavily interested in the slot machines, and in speaking of them he said to a *Press* reporter:

"There is an immense amount of capital invested in these little affairs. Erastus Wiman, of New York, was the first to bring them to this country, I believe, and about 1886 he placed in the large American cities weighing machines. These make a great deal of money, and then H. K. Thurber started in with the slot machine which sold candy and chocolate. Mr. Wiman thought he had a patent for the United States, and a costly lawsuit followed. During this the records of the patent office at Washington were examined, and they found that 100 years ago a man in England, who kept a tavern, made use of the slot machine. This was a tin box containing tobacco. The fre-

quenters of his tavern dropped a half-penny in the slot and it struck a lever which opened the box. Then the purchasers took out a pinch of tobacco and put it in one of the pipes lying around on the table in the bar room. This is the first slot machine of which any record is known. Nowadays they sell everything in them, especially in England, where they are used for postage stamps. In Washington the other day I saw a slot machine into which you drop two nickles, and from which you obtain a glass of rock-and-rye. I do not think that any of the machines cost over \$30. And if only one per cent profit is made every day, it means 10 per cent interest on the investment. The first month our company placed a machine in the Hoffman House in New York city it took in \$46. A certain dry-goods firm recently put out a lot of slot machines which sell lead pencils. You put a penny in the slot and out comes a pencil nicely sharpened and covered with the advertisement of the firm. The latter estimates that the advertisement pays all expenses, and so the pennies taken in are clear profit."

**Brother Gardner on Astronomy.**

"I hold hear, in my han'," began Brother Gardner, as the thermometer showed the usual 120 degrees in the vicinity of the stove, "a letter from Philadelphia axin' me if I believe wid de Rev. Jasper of Richmond dat de sun do move. Sartin I do. I know de white folks claim dat it am de airth which am movin', while de sun stands still. but right dar' we split. Joshua was about as nigh bein' an angel as any white man will eber git, an' when he ordered de sun to stan' still he knew what he was talkin' 'bout. It would have been just as easy fur him to have commanded de airth to stan' still, but he didn't do it. If Joshua didn't know his bizness de rest of us might as well hang up.

"An' now, you cull'd folkses, min' what I've gwine to say. Doan' let de 'stronomy bizness keep you awake nights. De sun am up dar by day, an' de moon an' stars am up dar by night. De Lawd put de sun dar to thaw de ice off de back doar step, make cucumbers grow and fotch up de grass an' de co'n. It didn't do any wuss when astronomy was unknown, an' it wouldn't do any better if ebery family in de kentry had a telescope fo' hundred feet long. De moon was hung up dar, dat folks might see to move by night when de rent got too high; dat lost cows could see to fin' dar way home; dat folks could see to chop wood an' empty bar'ls of ashes on de street; dat wimin comin' home from pray'r meetin' could avoid de nail heads stickin' up in de planks, an' fur var'us oder reasons. You

jist take de sun as he runs an' de moon as you fin' it, an' de lees you worry 'bout 'em de mo' meat an' 'taters you'll have in de winter. De poorest cull'd man I eber knowed was an ole black man down in Varginny, who was always wonderin' if dey had a reg'lar lock on de gates of heaven, or only a latch string. While his nayburs war' plantin' he was wonderin'; while dey war' boin' he was theorizin'; while dey was reapin' he was ragged an' hungry. Let de sun move or stan' still—let de moon be made of old silver or green cheese—let de stars be ten miles or 10,000,000 miles away—keep de whitewash brush gwine an' de bucksaw in good order an' you'll be all right."—*Detroit Free Press.*

### The Koran and Iron.

Iron, we all know, is occasionally referred to in the Bible; but not so many are perhaps aware that the most common and useful of metals forms the title of a division of the Alkoran of Mohammed. Yet this is the case. The fifty-seventh chapter of the Mohammedan Scriptures is entitled "Iron; Revealed at Mecca or at Medina." For singularly enough, it appears to be uncertain which of the two Arabian cities was the scene of the revelation of this portion of the Koran. Although the word iron, as we see, constitutes the title, it is found but once in the chapter—namely, in the sentence, "And we sent them [men] down iron, wherein is mighty strength for war and various advantages unto mankind." The legend embodied in the note of the commentator to the first phrase is curious. It runs as follows: "That is, we taught them how to dig iron from mines. Al Zamakhshari adds that Adam is said to have brought down with him from Paradise five things made of iron—namely, an anvil, a pair of tongs, two hammers—a greater and a lesser—and a needle!" It is interesting to note in the above quoted sentence of the chapter that the fact that iron is a substance "wherein is mighty strength for war" seems to be of first importance. The "various advantages unto mankind" are apparently a secondary consideration.—*Iron.*

### Why They Liked It.

A story is told by a French paper of two provincials, a man and his wife, who visited the Louvre in Paris.

"What struck you most at the Louvre?" asked one of their friends when they returned home and began to tell of the wonders they had seen.

"Oh," replied the husband, "a picture which represented Adam and Eve, with the apple and the serpent."

And his excellent wife chimed in: "Yes, we found that very interesting, because, you know, we know the anecdote."—*E.c.*

### Carries Part of His Skull in His Pocket.

Peter C. Wedell, while on the witness stand in Judge Slover's court recently, pulled out of his pocket a piece of his own skull about the size of his hand wrapped in a piece of paper, and unwrapping the trophy exhibited it to the jury, after which his attorneys offered it in evidence, but the jurymen made haste to announce that it was sufficient for them to have seen it.

Mr. Wedell, who is a good looking man of 35, when he has his hat on, also exhibited his head to the jury with his hat off. The left side of the cranium was bare of hair over a spot about the size of a horse-shoe, where the piece of skull was taken out, and the pulsations of the brain could be distinctly seen. Wedell was for fourteen years a locomotive engineer on the Missouri Pacific railroad, which he is now suing for \$40,000 damages on account of his injuries.

He was hurt near Atchison August 10, 1892, by his head coming in contact with a standpipe as he was leaping out of the cab of his engine while it was running at full speed. The standpipe had been set up so near the track that his head hit it while he was "on the lookout" ahead of his engine. He alleges carelessness on the part of the company in having it set so near the track.—*Kansas City Journal.*

THE hard times do not bring slow times to railway trains, although they compel reduction of expenses in many other ways. The public has been educated to fast traveling, and while this means increased cost and risk to the railways there is no disposition indicated to return to the average speed which was thought high a few years ago. On the contrary, the summer timetables show some notable lessening of the time of journeys. The New York Central and the Pennsylvania each have put in service twenty-four hour trains between New York and Chicago, which run as fast as anybody ought to ask to ride. The Central's flyer leaves New York at 11 A. M. and reaches Chicago at 10 A. M., local time; the Pennsylvania limited starts at 10 A. M. and completes the run at 9 A. M. Going east both trains start at 5:30 P. M. and reach destination at 6:30 P. M. eastern time. Amid the superb appointments of these wonderful trains, timed so as to pass through the most attractive scenery by daylight, and with facilities for taking three "square meals"—or meals of triangular or circular shape, if preferred—the time passes quickly away, and to most travelers the journey seems too short rather than too long. For all that the railways are voluntarily doing for their comfort those who journey certainly ought to feel a warm sense of gratitude.—*Railway Age.*

**LITTLE THINGS.**

A good-bye kiss is a little thing,  
 With your hand upon the door to go.  
 But it takes the venom out of the sting  
 Of a thoughtless word or a cruel fling  
 That you made an hour ago.

A kiss of greeting is sweet and rare  
 After the toil of the day.  
 And it smoothes the furrows plowed by care.  
 These lines on the forehead you once called fair,  
 In the years that have flown away.

'Tis a little thing to say, "You are kind,  
 I love you, my dear," each night.  
 But it sends a thrill through your heart, I find,  
 For love is tender, love is blind,  
 As we climb life's rugged height.

We starve each other for love's caress,  
 We take, but we do not give;  
 It seems so easy some soul to bless,  
 But we dole the love grudgingly less and less,  
 Till 'tis bitter and hard to live.

—Pittsburg Bulletin.

**Petrified Prices.**

We were sitting on the tavern veranda after supper for a smoke, when an old darky with a crooked leg came along and took off his hat and said:

"Gem'len, I should like to ax yo' a few qeshuns, please."

Being told to go ahead, he came up the steps, bowed and scraped, and observed:

"I lost my ole woman dooin' de wah, an' she was buried on de gravel ridge ober yere 'bout two miles. I dun went an dug up de body last week to put it in a new place, and it was all paralyzed to stun."

"You mean petrified."

"Dat's it, sah. Took fo' men to git it out of de grave. Just dun turned into rock an' looked as nateral as life. Seemed like I was dun talkin' to de ole lady agin,"

"Yes."

"She was lyin' dar on de grass when a feller driv up in a wagin and offered me \$5 fur de body. Do yo' reckon it was right to sell it?"

"Well, that's according to your own feelings."

"Jest so. She was dun dead."

"Yes."

"An' all turned to stun."

"Yes."

"An' so I reckoned it wouldn't hurt nuffin. I got de money an' de man driv off. An' now Uncle Jason tells me dat I got cheated. He says a paralyzed body am wuth \$30. Can yo' tell me if dat's so?"

"You ought to have got at least \$25."

"Hu! Den I was cheated?"

"It looks that way."

"Jest beat right outer \$20! Hu! Wall, dey doan play dat trick on me agin. I'se got de market price now, an' I knows what figger to ask."

"But the body is already gone."

"Yes, dat body, but I dun buried two odder wives an' three chillen on dat same grave ridge, an' when I get 'em dug out dey is gwine to fetch market quotashuns or I'll tumble 'em right back in agin!"—*M. Quaid.*

THESE are the days when a girl loves to sing about jingling sleigh-bells and Christmas trees. She may be sipping lemonade and fanning herself furiously, but all the time she's dreaming of that nice, lovely blizzard that we had last winter. Girls don't like warm weather. Shiny noses that might be mistaken for ivory paper-weights and bangs that would make first-class chimney-cleaners are not especially in favor. There's mighty little harmony in the uncurled curls and wilted collar combination, and few dispositions can hold out against it. Surely if you are a man you must have noticed how all your girl friends skip past you with a cold nod that is out of keeping with palm-leaf fans and iced coffee. You see they do that for your own good, for they realize that at a single sight of their poodle-like heads you may die of plain every-day fright. They don't have to be told that they are sights. They know it the very minute their bangs straighten out with all the stiff unbending lankness of a dead pussy cat. Some girls say that life isn't worth the trouble of living in summer. Others declare that warm weather is positively the only decent season. These last damsels have naturally curly hair and freckleless noses. There are reasons for all opinions.

NEARLY all of the inventors of devices intended to act as flying machines seem to think that it is most important to be able to soar to great heights. While this might be very pleasant, much the same as a cruise in a pleasure yacht, yet the Atlantic liners generally try to make the most direct route, and so flying machines intended merely for purposes of commercial transportation need only rise high enough to clear terrestrial obstructions and obtain for themselves what may be termed a clear "air way." It is not impossible that such moderate heights might permit transfer of power without a conductor, and so avoid the necessity for carrying the power generating machinery, which would certainly enable a large portion of dead load to be omitted.—*The Engineer.*

THE bank of England, which is the great depository of bullion in the realm, holds at ordinary times in its vaults \$125,000,000. The bank of Germany holds \$200,000,000 of bullion in gold and silver. The bank of France usually holds \$475,000,000. The United States holds in the treasury and in the various national banks somewhere about \$700,000,000 in gold and silver. The increasing wealth of the various nations is somewhat remarkable. During the last ten years the bank of France has more than doubled its reserves. The bank of Germany in 1881 held about \$140,000,000.—*Drake's Magazine.*

### A Summer Picture.

There were white clouds in the sky; not enough to obscure the sunlight but only to temper its dazzling radiance. The water was as blue as the sky and almost as bright, except where the reflected clouds made patches of shadow. The white sails of boats gleamed in the sunlight or loomed up darkly, richly gray in the shadow. The air was laden with the briny odor of the sea and to breathe it was to feel rejuvenated and strengthened.

Back from the shore stood the picturesque cottages, with their gable roofs, their turrets, their unexpected angles and bows and curves, their balconies and piazzas. Gay flower beds bloomed before them. Muslin curtains waved in the windows. Gay hammocks were hung here and there and rough, rustic benches were made gay with cushions. Altogether it seemed an ideal summer place.

Both the young women who stood on one of the piazzas, looking wistfully out to sea, sighed drearily.

"It's no use," she said decidedly. "It's a pretty place and a charming house. But I can't take it. My husband could never stand the dampness of that wet water."—*New York World.*

### Wanted, a New Coin.

In these days of money discussions it is pertinent to call attention to a much needed coin. The denomination in mind is a 9 cent piece. Modern business ingenuity and enterprise have brought about a fine discrimination in the matter of selling prices, and instead of being satisfied with fixing their profits in decimals and demi-decimal denominations find it to advantage to make the concession of a single penny on a \$5, \$10, or \$15 sale. In values that are less than \$5 it is almost as common to see 99 and 49 figures as it is those ending with 0 and 00. In fact, a 9 cent piece is now as necessary as a 10 cent piece.

It is very pleasant to our feelings and desirable to our purses to enter a large store and purchase a 20 cent collar for 19 cents, but it transforms us into pestiferous and cranky individuals to be compelled to stand on one foot for twenty seven minutes and wait for the return of the penny due in change. The pennies we save in promiscuous buying would provide us with afternoon papers and postal cards, but the time lost in waiting for change would make an annual income sufficient for an African prince.—*Shoe and Leather Facts.*

### What For?

A—"Hello, Charlie! Mustache cut off, I see. What did you have that done for?"

B—"Fifteen cents."—*Harvard Lampoon.*

### A Railway Mistake.

A man went to a certain railway station in New Jersey to buy a ticket for a small village called Morrow, where a station had been opened only a few days previously. "Does this train go to Morrow?" asked the man, coming up to the office in a great hurry, and pointing to a train on the track with steam up and every indication of a speedy departure.

"No; it goes to day," replied the ticket agent curtly. He thought the man was "trying to be funny."

"But," rejoined the man who was in a great hurry, "does it go to Morrow to-day?"

"No, it goes yesterday, the week after next," said the agent sarcastically, now sure that the inquirer was trying to make game of him.

"You don't understand me," cried the man, getting very much excited, as the engine gave a warning toot; "I want to go to Morrow."

"Well then," said the agent sternly, "why don't you go to-morrow, and not come fooling around here to-day? Step aside, please, and let the lady approach the window."

"But, my dear sir," exclaimed the bewildered inquirer, "it is important that I should be in Morrow to-day, and if the train stops there, or if there is no train to Morrow to-day"—At this critical juncture, when there was some danger that the mutual misunderstanding would drive both men frantic, an old official happened along and straightened out matters in less than a minute. The agent apologized, the man got the ticket and the train started for Morrow to-day.—*Youth's Companion.*

### A Sign of Mental Activity.

"Talking to one's self is generally considered a sign of a weak brain," said a doctor, yesterday, "but nothing could be a greater mistake. It is a sign of an extremely active brain. It may be a strong or a weak intellect, but the activity must be there to cause this peculiarity. If you will observe you will be astonished how many people you will meet on the street who are thinking aloud. The talking is done unconsciously. Often the people addicted to the habit, if you called their attention to it, would aver that they never were guilty of such a thing. Some of the brightest men I have ever known do their thinking aloud without knowing it, and, on the other hand, some of the weakest individuals, mentally, whom I have met in my practice keep up a continuous conversation with themselves. So it would seem that a man who talks to himself must be one of two extremes, a wise man or a fool."—*Pittsburg Dispatch.*

# GRAND LODGE.

## Quarterly Dues Notice.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., July 1, 1894. }

### To Members of Subordinate Lodges:

SIRS AND BROTHERS:—Pursuant to Section 129 of the Constitution, you are hereby notified that the dues for the quarter ending October 31, 1894 (such an amount as may be determined by the several lodges, provided in no case it shall be less than five (\$5.00) dollars), are now payable, and must be paid to the Collector of your lodge on or before August 1, 1894. This amount will be in full payment of all subordinate dues and beneficiary assessments levied by the Grand Lodge for said quarter, as provided in Section 132 of the Constitution. All beneficiary members now enrolled and all those admitted prior to September 1, 1894, are liable for the full amount of quarterly dues for said quarter. All members initiated during the months of September and October are exempt from payment of quarterly dues for said quarter, as provided in Section 129 of the Constitution. Any member failing to make payment as above provided will be expelled from the order, as per Section 130 of the Constitution, said expulsion taking effect August 2, 1894, and the Secretary is required to make due report thereof to the Grand Lodge.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

### Notice to Secretaries.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., July 1, 1894. }

### To Secretaries of Subordinate Lodges:

SIRS AND BROTHERS:—Pursuant to Sections 127 and 128 of the Constitution you are required to report to the Grand Lodge as expelled all members who fail to make payment of their Grand Dues for the year ending July 31st, 1895. The names of said members must be reported to you by the Collector of your lodge not later than August 2d, and by you reported to the Grand Lodge immediately thereafter. Failing to report the names of expelled members as herein provided, the Grand Lodge will hold subordinate lodges liable for their Grand Dues as per Section 53 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## Grand Dues Notice.

1894-95, \$2.00.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., July 1, 1894. }

### To Subordinate Lodges:

SIRS AND BROTHERS:—You are hereby notified that the amount of *Two Dollars* (\$2.00) for Grand Dues for the year ending July 31, 1895, is now due and must be paid on or before August 1, 1894. Any member failing or refusing to make payment of his Grand Dues as above required, will stand expelled, said expulsion taking effect August 2d. Collectors are required to deliver their returns for Grand Dues, together with the proper statements, to the Receivers of their lodges not later than August 5th, and Receivers are required to forward the same so as to reach the Grand Lodge not later than August 10th, as provided in Section 127 (Page 43) of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

### Notice to Secretaries.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., July 1, 1894. }

### To Secretaries of Subordinate Lodges:

SIRS AND BROTHERS:—Pursuant to Section 130 of the Constitution, you are required to report to the Grand Lodge as expelled all members who fail to make payment of their quarterly dues for the quarter ending October 31, 1894. The names of said members must be reported to you by the Collector of your lodge not later than August 2d, and by you reported to the Grand Lodge, in the prescribed form, immediately thereafter. Failing to report the names of expelled members as herein provided, the Grand Lodge will hold subordinate lodges liable for their assessments, as per Section 53 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

### Notice to Receivers.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., July 1, 1894. }

### To Receivers of Subordinate Lodges:

SIRS AND BROTHERS:—You are hereby notified, as provided in Section 54 of the Constitution, that no beneficiary assessment is required for the month of July, 1894, and that therefore none has been levied for said month.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

### Special Notice.

No lodge should be without a copy of the latest book of schedules of wages and agreements between Engineers and Firemen and Railway Officials. We have a large supply on hand and will furnish them to subordinate lodges at seventy-five cents per copy. Send your orders at once and they will be promptly filled. All orders must come through the Secretary or Acting Secretary of the lodge.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## Beneficiary Statement.

OFFICE OF GRAND SECRETARY AND TREASURER, )  
TERRE HAUTE, IND., JUNE 1, 1894 )

To Subordinate Lodges:

SIRS AND BROTHERS:—The following is a statement  
of the Beneficiary Fund for the month of May, 1894:

## RECEIPTS.

Lodge No.	Amount.	Lodge No.	Amount.	Lodge No.	Amount.	Lodge No.	Amount.	Lodge No.	Amount.
1	\$280	78	\$92	145	\$140	217	\$289	361	\$141
2	42	79	100	146	160	218	274	362	42

## "LIKE HIS MOTHER USED TO MAKE"

"I was born in Indiany," said a stranger lank and slim.

As us fellers in the restaurant were kind o' gyin' him,  
And Uncle Jake was slidin' him another pun'kin pie,  
And an extra cup of coffee, with a twinkle in his eye—  
"I was born in Indiany—more'n forty years ago.

And I hain't been back in twenty—an' I'm workin'  
back'ards slow;

But I've et in every restaurant 'twixt here and Santa  
Fe.

And I want to state this coffee tastes like gittin' home  
to me.

Pour us out another, daddy," said the feller warmin'  
up.

A-speakin' 'cross a saucerful, as uncle took his cup—  
"When I seed your sign out yonder," he went on to  
Uncle Jake—

"Come in and get some coffee like your mother used  
to make."

I thought of my old mother and the Posy county farm,  
And me a little kid ag'in a hangin' in her arm

As she set her pot a bilin'—broke the eggs and poured  
'em in."

And the feller kind o' halted with a tremble in his  
chin.

And Uncle Jake he fetched the feller's coffee back  
and stood

As solemn for a minute as an undertaker woy'd;  
Then he sort o' turned and tiptoed to rds the kitchen  
door, and next

Here comes his old wife with him, a rubbin' of her  
specs.

And she rushes for the stranger, and she hollers out  
"It's him!"

Thank God, we've met him comin'! Don't you know  
your mother, Jim?"

And the feller as he grabbed her, says: "You bet I  
hain't forgot"

But wipin' of his eyes, says he, "Your coffee's mighty  
hot."

—James Whitcomb Riley.

# Engineers and Firemen!

## STANDARD LITERATURE.

**These Books Will Help You to Master Your Calling  
and Get "On Top."**

**"Locomotive Catechism,"** by ROBERT GRIMSHAW. Nearly 400 pages. Full of cuts and illustrations. Fresh from the press and fully up to the times; **Price, \$2.00.**

**"New Catechism of the Locomotive,"** by M. N. FORNEY. More than 700 pages and more than 500 engravings. Greatest book published. **Price, \$3.50.**

**"Compound Locomotives,"** by ARTHUR T. WOODS. The only book on the subject. Should be in the hands of every student of the locomotive. **Price, \$1.**

**"Air Brake Practice,"** by J. E. PHELAN, of the Northern Pacific R. R. An exhaustive treatise on the Air Brake; explains in simplest language how to operate it under all conditions. **Price, \$1.00.**

**"Progressive Examinations of Locomotive Engineers and Firemen,"** by JOHN A. HILL. A capital little book for new beginners. An excellent pocket companion. **Price, 50 Cents.**

**"Alexander's Ready Reference,"** by S. A. ALEXANDER, for engineers and firemen. This book contains more valuable information in fewer words, and is easier understood by railroad men than any other book now in print. **Price, \$1.50.**

**"Twenty Years with the Indicator,"** by THOS. PRAY, JR., M. E. Copiously illustrated and containing many rules as to the best way to run any steam engine to get the best results. **Price, \$2.50.**

**"Simple Lessons in Drawing,"** by ORVILLE H. REYNOLDS (Chief Draftsman, Northern Pacific Railway). A splendid book. Every student of locomotive engineering and every explorer in the field of mechanics should have it. **Price 50 cents.**

**"Roper's Hand Book of the Locomotive,"** by STEPHEN ROPER. One of the most valuable treatises ever written on the subject. It is fully illustrated, and contains a description of the most approved locomotives in use. **Price, \$2.50.**

**"Locomotive Running Repairs,"** by L. C. HITCHCOCK. A splendid little book for locomotive men. **Price, 50 cents.**

**DEBS PUBLISHING CO.,**

**TERRE HAUTE, INDIANA.**

Do You Want a Picture of the

## FAMOUS "999" LOCOMOTIVE?

We've had hundreds of letters asking for a picture—now we have it. Something better than a photograph. A **transparent**, copper-plate engraving of the famous flyer; you can see everything **outside** and **inside**. Every part is numbered and named. Fit for a gold frame in a palace. Printed on satin gloss paper, 14x28, and mailed in a tube (without folding) for 50 cents (stamps are good, but we would rather have postal notes or money orders). This is an educational device, up to date, unique, beautiful and correct. Once seen, no other picture of this beautiful locomotive will satisfy you at all. Send cash with order. **LOCOMOTIVE ENGINEERING, 5 Beekman St., New York City.**

If you are a subscriber, for 1894, to our paper, **Locomotive Engineering**, you get the above picture and our other little school masters, the **Traveling Engineer's Examination Chart** and the **Working Model of the Triple Valve**,

► **FREE.** ◄

The paper has over 40 large pages and is the best illustrated and "**most interesting railroad paper published.**" Practical, instructive, interesting! No engineer, fireman or shop man can afford to be without it. Sent to any address in the world for \$2.00. Angus Sinclair and John A. Hill, Editors. Specimen Copy, free. Address

**Endorsed by Fairmount Lodge,**

**No. 333, of the Brotherhood  
of Locomotive Firemen.**

PHILADELPHIA, PA., April 6, 1894.

Mr. H. C. Reagan:

DEAR SIR AND BRO.:—We, as Fairmount Lodge, No. 333, of the Brotherhood of Locomotive Firemen, having carefully gone over the contents of your work on Locomotive Mechanism and Engineering, unanimously resolved—

That we tender our earnest congratulations to you, on this successful undertaking, and, as it fills a long-felt want among our class, we give it the endorsement and recommendation of this lodge.

Attest: H. L. STERLING, Master.

WM. H. ELLIOTT, Secretary.

## Locomotive Mechanism and Engineering.

By H. C. Reagan. Explaining Fully and Clearly the Construction and Action of Simple and Compound Locomotives. Illustrating the principal "break-downs" which happen to a Locomotive, with Complete Directions what should be done when one occurs "on the road." Questions and Answers are so arranged that they can be used by Master Mechanics or Travelling Engineers, or by the Demonstrator in the Lodge Room. 145 illustrations. 300 pages. 12mo, cloth. \$2.00.

# PERFECT RAILROAD WATCHES

HIGHEST GRADE

ROCKFORD

WATCH CO.

15 JEWEL

MOVEMENT.

GUARANTEED

TO PASS

RAILROAD

INSPECTION

**COSTS NOTHING  
TO EXAMINE.**

**Jos. Fahys & Co.'s "Montauk,"** dust proof, open face case, 10k gold filled, screw back and bezel, neatly and artistically engraved, and accompanied by the **manufacturer's signed guarantee to wear for fifteen years.** Fitted with No. 87 Rockford movement as described below,

**\$22.50.**

**American 14k Gold Filled Hunting Case,** elegantly engraved and finely finished, and accompanied by the **manufacturer's own guarantee to wear for twenty years.** Fitted with No. 84 Rockford movement as described below,

**\$25.15.**

The No. 87 Open Face and No. 84 Hunting Movements are the highest grade 15-jeweled movements made by the Rockford Watch Co. They have fifteen finest ruby jewels, in solid gold settings, Breguet hair-spring, patent micrometer regulator, fancy or double sunk dials, and are elegantly damaskeened in gold on solid nickel. They are fully adjusted to heat, cold and positions, will pass railroad inspection, as they comply with the requirements of railway time orders, and are acknowledged the best movements ever offered for the money.

**With each movement is sent a signed and numbered guarantee and our agreement to clean and oil movement once a year for five years from date of purchase.**

For the benefit of those who do not wish to purchase higher priced cases, we will furnish these movements in **Dueber Silverline Cases** at the following prices: No. 87, \$15.95; No. 84, \$16.60, and will allow a credit of 75 cents for the open face and \$1.25 for the hunting case (when returned) on any purchase of a solid gold or gold filled case for the movement made within one year..

**Samples** of these watches can be seen and purchased for above prices at any Express Office in the United States. If the agent of the express company doing business in your town has not samples on hand, write us, giving his name and name of the company, also stating which watch you wish to examine, and we will at once forward samples for your inspection. If the watch is satisfactory, pay the agent our price and he will deliver it to you, otherwise you do not pay a cent.

# Marks' Patent Artificial Limbs

WITH RUBBER HANDS AND FEET

Are Natural in Action, Noiseless in Motion, and the Most Durable in Construction.

It is not unusual to see an engineer with hand on the throttle, or a conductor, baggage-master, brakeman, fireman, carpenter, farmer, mason, miner, and in fact men of every vocation, wearing one or two artificial legs, with rubber feet of Marks' Patents, performing as much labor as men in possession of all their natural members, earning the same wages; in fact, experiencing little or no inconvenience.

Over 15,000 in use, scattered in all parts of the world. Eminent surgeons and competent judges commend the Rubber Foot and Hand for their many advantages. At every industrial exhibition where exhibited they have received the highest awards. They are endorsed and purchased by the U. S. and foreign governments. A treatise, containing 430 pages, with 260 illustrations, sent FREE; also a formula for taking measurements by which limbs can be made and sent to all parts of the world with fit guaranteed.

Address,

**A. A. MARKS,**

Established  
Forty-one Years.

701 Broadway, New York City.

Received the Highest Award at World's Columbian Exposition.

## "PULL YOUR LEG"

Is less to fear with Railroad men than to Lose Your Leg. In the latter case you surely want to replace it with a **Patent A-justable Slip Socket**. Warranted *not to Chafe the Stump*. Received the Gold Medal and the Diploma at the World's Fair.

**LARGEST FIRM IN THE UNITED STATES.**

The Inner Socket, seen outside the limb in cut, is made over a plaster cast of the stump, giving an exact fit, being held permanently upon the stump by elastic fastened to lacer above, and in act of walking moves up and down in the Outer Socket, bringing all the friction between the two sockets, instead of between the stump and the socket as is the case of all wooden socket limbs. With our **SLIP SOCKET** the most tender, sensitive stump can be fitted and limb worn with perfect ease and comfort. Endorsed and purchased by United States Government. Send for our New Catalogue with illustrations

## POCAHONTAS Semi-Bituminous Coal.

1 Broadway, New York. 308 Walnut St., Philadelphia  
70 Kilby St., Boston. 36 Main St., Norfolk, Va.  
1 Fenchurch Ave., London, England.

The Pocahontas Coal is acknowledged by all railroads that have used it to be the best American coal for Locomotive use. It generates steam with great rapidity, and at the same time holds the fire an unusually long time. The merits of the coal are shown by the unprecedented growth of the mines, which were not opened until 1883. Since that time the out-puts have increased over 1,300 per cent. beyond all precedent, amounting during 1892 to 3,000,000 tons. During the present year it will be at least 2,000,000 tons. We are therefore prepared to fill all orders with prompt dispatch.

CHAS. MILLER, President

# Galena Oil Works, Limited. FRANKLIN, PA.

## SAFETY, SPEED, ECONOMY

Are the results of the use of Galena Oils. Scientific and practical tests of the past twenty years have demonstrated the fact that Galena Oils are superior to any other oils in the market.

Galena Oils in winter stand a cold test of from ten to fifteen degrees below zero, and will not freeze in the coldest weather.

The superiority of Galena Oil is demonstrated by their exclusive use upon a large majority of the railways of this country. They are in use upon three continuous lines of railways from Boston and New York to the Pacific coast and on one to the City of Mexico, thus demonstrating their adaptability to all climates and all temperatures.

We also supply our patrons with Sibley's Perfection Valve Oil, which is in exclusive use upon a large majority of the leading railroads of the country.

When addressing our advertisers mention this Magazine.

WILLIAM SELLERS & CO., Incorp., Philadelphia, Pa.

Sole Patentees and Makers of

# Self-Acting Injector of 1887.

**NOTE**—There are many injectors which will work well when the conditions are favorable. This injector is designed to work well under all conditions and is, therefore the most reliable.

**IT WILL RE-START ITSELF.**

**IT WILL ADJUST ITSELF.**

**IT WILL LIFT HOT OR COLD WATER.**

Its range of capacity is over 60 per cent. and it can be regulated, therefore, to work continuously for light or heavy trains. It is operated by a simple lever motion which readily starts and stops its action.

## THE TOOLS TO THE TOILERS.

BY JOSÉ GROS.

For the last three years '91, '92 and '93, this MAGAZINE has published about 120 anti-socialistic articles, and about 50 from socialistic writers. Not a single assertion, in the latter, has been left unanswered, from different points of view, while none of the fundamental principles in the 120 articles have been disproved by socialists. They have simply overlooked them, or misrepresented them, or made fun of them. The latter always proves that the writer is at the end of the rope, in a ditch from which he cannot get out.

All the above can be verified by any of our readers who may see fit to overhaul the articles in question, even if they, the readers, fail yet to be convinced in any given direction.

Towards the end of '92, and for about 12 consecutive months, the writer tried to expand the subject of social growth, in order not to tire out our readers if we kept always hammering on the same hobby or side in social phenomena. We had to return to the only spot in which the fight was going on, and thus combat the same old fallacies forever reproduced by the open or hidden enemies of progress.

During the first four months of the present year we all have tried to diversify our subjects. For two or three months the tendency is again towards concentrating the fight in a single battle field. We have never taken the trouble of fussing any where around the baggages, in the march of civilization. The churches and the plutocrats are enough for that job. We must then pitch into the old battle field again, boots and all. We hope our readers will be indulgent with us. We shall not imitate that friend of ours, the socialist who is trying to feed us again with the same identical facts, and language, fully answered, and with which he did treat us for about eight months in the year of grace 1893. We don't object to a plate of hash now and then ; but

dislike it when cooked over. We shall then approach the battle field through different roads, fighting with improved guns and tactics, to the best of our ability.

We like the socialistic motto of " the tools to the toilers ; " but we don't consider that quite sufficient. We want the toilers to have, not only the tools, but the wealth, and all of it, since it is all produced by them. Hence we want the toilers to have all the land values too. And we want the toilers to control everything through the simplest process of universal *ethics* and *freedom*, not through the complicated devices of officialism which have always tended to despotism. There is the open issue between us and socialists.

Already over twenty years ago we were often raising the dust among our plutocratic friends by telling them that all land belongs to the toilers, in the order of nature, and hence in the order of God. Their line of defense was always as follows : Land can be had very cheap, if the workers want to have it. And that is just the direct or indirect argument with which socialists combat the very reform which would constitute an enormous step towards the socialistic ideal, if humanity can ever be coaxed into it, or if it is at all possible. The blindness of the theologians of the past and the present is no where compared with that of socialists.

To speak of cheap land under monopoly rule, under taxation on all that labor is to produce and consume ; under restrictions in production and commerce ; under patents and franchises with which we give to some the power to tax, to rob, the rest ; under public debts ; under the political monopolies we call freedom, and with which we convert the ballot into a farce ! It is no doubt pitiful to hear reformers talking like the enemies of humanity in all historical periods, using the same arguments, parrot-like. ! According to such reformers the taxing of monopoly instead of labor will produce the same identical results that we have to-day when we tax labor and let monopoly rule supreme. It is just like saying that if

the sun should take the place of the moon, by night, darkness would still prevail on the side of the planet flooded by the sunlight.

Gentlemen of all schools or of no school at all, land has never been cheap and can never be cheap, to the toilers, until we give it to them, all of it, free, with the land values they create, to be determined by themselves, and until we suppress all our infernal class legislation.

The trouble with our socialists is that most of them are either professional men, with no business grasp, or men who have always lived under bosses. The latter condition, depending on a boss for a living, kills, in many cases, our analytical faculty, and all power to digest thought. Then, let the mind become entangled into schemes loaded with minute details, as it is the case with the socialistic ideal, and the mind is then petrified into a crude mechanism, divorced from all natural law and all natural rights. No wonder that such men implicitly believe themselves to be wiser than God, or wiser than the clay and unconscious forces from which they come. Our friends can choose between the two sides of the dilemma. No trouble about that, and they don't need to grumble if we refuse to worship the idols they have built up, by which-ever iems on this side of Hades they may be known.

We tried to show, in the *Twentieth Century* for March 15th of this year, that taxation on land values could be established under plutocratic principles, as well as under democratic ones, for the benefit of monopolies as well as for that of the workers of nations. All in life is a question of classification. No science is possible without that. Yet, socialists want to deal with the greatest of all sciences without the use of classification. Never any desire to discriminate between the working and the loafing capitalist, between interest from loans and that increased product that labor should receive when working with better tools, belonging to the capitalistic worker, because the loafing one is the product of monopoly in natural resources or class legislation, and would rapidly vanish without all that. Never any wish to differentiate between competition under monopoly rule, and that under conditions of real freedom in all production and commerce, because of freedom in all natural resources, and no privileges to any body in any form whatever, just the opposite of what has been the case under all social compacts!

That reluctance to all classification, on the part of socialists, for fear that that will kill their pet schemes, that alone makes such schemes stand self condemned in the eyes of those who have time, patience and sufficient impartiality to review their whole plan of social re-organization. As such a plan

rests on officialism, bossism, on a delegated plutocracy instead of the self appointed one of all times, of course that socialists cannot very well take cognizance of taxation in land values codified by the people for their benefit. Don't you see that they don't conceive how real freedom can be made to work correctly? Don't you see that they have not confidence enough in the average intelligence of the individual man? Don't you notice that their whole social scheme is based on the authority of the few regulating all production and commerce, fixing the hours of labor and the earnings of every son of Adam right and left?

Our present social combinations are bad enough. They consist of a self appointed industrial oligarchy in close alliance with a delegated political oligarchy. Socialism would give us a delegated oligarchy with both political and industrial power to handle humanity as a pack of sheep, to which we had given the right to vote what the few proposed according to their views of life: just what has taken place so far under our political system of delegated political oligarchies. You would simply have the same process extended to all industrial ramifications.

We can hardly escape from the above alternative until men see fit to grasp the most self evident fact in the whole range of economic thought. It is as follows:

You cannot control the waters of a stream without controlling the channel. Hence you cannot control any labor products, in the long run, without controlling the natural elements from which such products are to come, and on which they are to move, and rest, with the men who are to use them. Not until you fully grasp that self evident fact can you see the strict righteousness that would preside over a social compact resting on taxation in land values and franchises, as we have often specified. Now for the socialists again:

You can fry a lot of eggs, for instance, by simply holding the handle of the frying pan upon the fire, or you could hold the planets in their orbits by simple controlling the sun.

According to the logic of socialists neither of these two processes would do, they are too simple. In the case of the sun you should pin each planet in its orbit, stick it through, besides holding the solar disk, lest all planets fly off into infinite space. In the case of the frying pan, you should hold the pan itself with the eggs and the fat, besides the handle of the pan, lest the whole concern sinks down into the fire.

Welly joking aside, we fully endorse that good socialistic motto, "The Tools to the Toilers" only that is not enough. We want all the wealth, and the land, and the land values, controlled and possessed by the toilers, each one to control his share, himself alone, or in free association with other

men, without the least interference from any public boss. And hence we want all the above to rest on free competition among workers, and on free co-operation with all natural laws and ethical principles, without any monopoly whatsoever, political or economic.

Monopoly is but organized human selfishness, ingrained in human laws concocted by tyrants or plutocracies, self appointed or delegated. There is no special difference between the two, if history does not lie on the subject.

And that free competition among men, with their free co operation in connection with ethical and natural law is just what your socialists fail to conceive or cannot stand. They hate all law that has not been born in the socialistic mind, some any how, as Satan hates holy water. So they say. We don't know anything about it, because we never came across any other Satan but that of human selfishness. Selfishness itself is nothing but the human will saying: "I want to make my own laws." That applies to the individual and to the collective human group, to organized society.

Let us then place that society, and so the individual, in peace with natural law, the divine will follow if you don't get excited about it, and we shall develop all individuals as veritable kings and gods, just as it was decreed by a wise Creator, as soon as men should see fit to co-operate with Him for that purpose. That may necessitate the suppression of all delegated legislative bodies. Let the people, in annual or biennial elections, fix the simplest and most specific processes by which all fundamental law, ethical and natural, shall be allowed "free play."

### THE MUNICIPIAL PROBLEM.

BY WILFRED P. BORLAND.

Speaking of our cities, Bryce, in his excellent work, "The American Commonwealth," says: "There is no denying that the government of cities is the one conspicuous failure of the United States. The faults of the state governments are insignificant compared with the extravagance, corruption and mismanagement which mark the administrations of most of the great cities."

The growth of cities in the United States within the last fifty years has been something wonderful; nothing like it was ever before known in any part of the world. At the time of Washington's inauguration to the presidency there were no large cities. Philadelphia was the largest city in the Union, with a population of 42,000. New York came next, with a population of 33,000; and Boston, which came next in size, with 18,000, was not yet a city, nor did Boston become a city until 1822, at which time her

population was about 40,000. In 1800 there were but six towns in the United States that might be ranked as cities from their size. By 1810 the number had risen from six to eleven; by 1820 the number had reached thirteen; by 1830 it had become twenty-six, and in 1840 there were forty-four cities altogether. Thus, in the forty years following the beginning of the century, the number of cities increased by thirty-eight, and the urban population increased from 210,873 in 1800 to 1,453,994 in 1840. But in the next forty years, between 1840 and 1880, the number of new cities which came into existence was 242, and the urban population increased to 11,318,547. Take the city of Chicago as a remarkable illustration of this tendency to urban growth. That city has grown from 4,000 inhabitants in 1840 to more than 1,000,000 in 1890, a 250-fold increase in the space of fifty years. In 1790 but 120,000 of our 4,000,000 inhabitants resided in urban communities; in 1890 more than 10,000,000 of our 65,000,000 inhabitants resided in cities of over 100,000. This rapid growth has entailed some important consequences; it has raised up problems in government that could not have been taken account of when our general theory of government was originally worked out, and, as in all probability our cities are destined to increase both in number and size, it is certainly the part of wisdom to consider those problems with reference to their practical solution, rather than with reference to their relation with any particular theory of government. If democracy is incompetent to solve the municipal problem, so much the worse for democracy; but democracy must, at least, be given a fair trial before it is condemned as incompetent. Pointing to the serious evils of municipal government in this country, and calling attention to the undeniable superiority of municipal administrations in European cities, a certain class of publicists have given expression to extremely pessimistic views concerning the future of democratic institutions. They see nothing but evil for the future; they see the decadence and dissolution of the nation, all proceeding from influences generated in those "foul sinks of corruption"—the cities; and they sigh for some despotic power, some strongly centralized and arbitrary government, to deliver them from the consequences that have been conjured up by their own imagination, and what they are pleased to term "the evils of democracy." That there is such a sentiment as this abroad in this republic is undeniable; and that the sentiment has been generated by the scandalous corruption and mismanagement of our city governments is in many cases also beyond question. The municipal problem, therefore, assumes proportions of much more than a local or transient character; it has

become a national problem, and upon its proper solution depends the perpetuity of republican institutions in this country. The municipal problem is one of the most fundamental questions in American politics to-day, and for that reason workingmen should prepare themselves to understand it and see that it receives consistent and intelligent treatment. Democracy is something more than a name; it is a force that is capable of being used either for good or evil. It is not necessary, nor would it be correct, to admit that democracy has been used to produce evil in our cities; but the admission might be made without in any way weakening the proposition that the same force may be used so as to produce good. Necessarily, there are two sorts of democracy—direct and indirect—equally efficient if properly used and understood. I say "necessarily," because no way has yet been discovered whereby a considerable community of persons may secure the proper administration of their collective affairs except indirectly, or through representatives. The first sort finds its expression in our township government, as exemplified in New England and the northwestern states which have adopted it, and is a pure democracy. The other finds its expression in our county government, primarily, which is composed of representatives elected by the people and having delegated powers to make laws which shall be binding on all within its jurisdiction, within certain constitutional limits; it is representative democracy. Pure democracy has one signal advantage over all other kinds of government. It tends to make every man feel that the business of government is part of his own business, and keeps alive a spirit of direct responsibility for the proper conduct of public affairs which no citizen, however humble, can lose without endangering the liberties of all. Representative democracy, on the other hand, tends to weaken this feeling of individual responsibility in governmental affairs. All energies in this world are weakened from want of exercise, and when people have once got into the habit of leaving their local governmental affairs to be managed by representatives their political energy is apt to deteriorate. When some fit subject of complaint is brought up, the individual is apt to feel that it is none of his business, as long as there are proper officers elected to look after it. He casts his vote on election day, and thinks his duty ends with that assertion of his right of citizenship. That is a lesson that has to be learned yet: that the citizen of a democratic state has something else to do besides vote. This weakening of political energy seems to be inherent, and inevitable, in the representative system; nevertheless, pure democracy seems impossible of application to a wider sphere than the town-meeting. It may be

that the introduction of the initiative and referendum will have the effect to restore political energy and impart the feeling of responsibility generated by participation in town-meeting, and the measure is for this reason alone, if for no other, worthy of trial; but even this does not contemplate, in full measure, the elimination of representative democracy. Let it now be observed that representative government is necessary for cities. In counties, representative government is necessitated by the extent of territory covered; in cities it is necessitated by the large population. This is illustrated by the experience of Boston. In 1820, with a population of 40,000, Boston had 7,000 voters qualified to attend town-meetings, and "when a town-meeting was held on any exciting subject in Faneuil Hall, those only who obtained places near the moderator could even hear the discussion. A few busy or interested individuals easily obtained the management of the most important affairs in an assembly in which the greater number could have neither voice nor hearing. When the subject was not generally exciting, town-meetings were usually composed of the selectmen, the town officers, and thirty or forty inhabitants. Those who thus came were for the most part drawn to it from some official duty or private interest, which, when performed or attained, they generally troubled themselves but little, or not at all, about the other business of the meeting."—Quincy's *Municipal History of Boston*, p. 28.

"Under these circumstances it was found necessary, in 1822, to drop the town-meeting altogether and devise a new form of government for Boston. After various plans had been suggested and discussed, it was decided that the new government should be vested in a mayor; a select council of eight persons to be called the board of aldermen; and a common council of forty-eight persons, four from each of twelve wards into which the city was to be divided. All these officials were to be elected by the people."—Fiske's *Civil Government in the United States*, p. 162.

Being necessarily representative, the efficiency of municipal government may be said to depend on two primary conditions, viz.: the character of the representatives, and the constitutional limitations under which they labor. Under the first is, of course, included the assumption that the representatives shall possess proper and adequate knowledge of the requirements of municipal government; and under the second is included the assumption that the power delegated to the representatives shall be such as to permit them to go to the full length of their constitutional limitations whenever necessary. Neither of these primary conditions have been observed, except in a spasmodic and helpless sort of

fashion that amounted to nothing. Municipal government has been placed in charge of representatives whose character was such as to render it quite a matter of certainty that they would not do any good if they could; and then they have been hedged about with constitutional limitations such as to render it quite certain that they could not do any good if they would. National and state government is limited to work of general supervision; it is concerned with the establishment and enforcement of certain general principles. Municipal government, on the other hand, is a matter of details—and very intricate details at that. The administrators of municipal government are continually called upon to deal with problems which no general theory of government will fit, and which must be settled, if settled right, independent of any political considerations whatever. The theory of cities which has prevailed with us up to now, which regards a city as a little republic, a state in miniature, is not adequate. A rational view of cities is that which regards them as large corporations for the carrying on of a large business having many branches, most of which require administrators having special aptitude and training, and that they should be governed accordingly. What is the specific character of municipal government, what duties are its administrators called upon to perform? They are required to furnish large communities with necessary pavements, sewers, water, light, fire and police protection, transit facilities, etc., in the cheapest manner consistent with permanent and first-class work; and the necessities of the case are such that the administrators must be invested with the proper authority to carry out the purposes of their administration, just as the superintendent of a railroad must be invested with the proper authority to enforce discipline and institute proper methods of management for the conduct of the business in his charge. It is, perhaps, unnecessary to say that up to the present time municipal government in this country has not been generally viewed in a rational manner. The American people have become so inoculated with the terrible virus of partisan politics that it seems out of the question for them to view any governmental question in a rational manner. The multiplicity of details connected with city government, and the special knowledge required to grapple with them properly, renders it impossible that the great mass of citizens should be able to watch its operations closely. Much work must go on which cannot be intelligently criticized by the average voter, because it requires special knowledge which the average voter does not possess. Difficult and intricate problems in sanitation, and in engineering, for example, are continually presenting them-

selves for solution, which problems require to be dealt with by men possessing technical and scientific knowledge of the very highest order, and who must be in a position to feel that they owe allegiance to the inhabitants of the municipality alone and are answerable to them only for the proper performance of their duties. And when competent men are found to deal with these problems, they must be allowed *carte blanche* to deal with them in their own way, within the prescribed constitutional limitations, and must be made to feel that their tenure of office depends on their faithful and efficient performance of duties towards the municipality which employs them, and on that alone. This is the only way to secure clean and efficient administration of municipal government. It does not imply an abandonment of democratic principles, but it does imply the application of those principles in a special manner, and it further implies the entire divorcement of municipal from national and state politics. Once in a while it becomes necessary to teach party organizations to know their place, and there should be no delay in giving them to understand that, however serviceable they may be in national affairs, they have no place whatever in municipal politics. The object of a municipal election is simply to secure an upright and efficient municipal government, and to elect a man to a municipal office because he happens to be a democrat or a republican, a protectionist or a free-trader, a prohibitionist or a populist, is about as sensible a proceeding as to elect him because his father was an Irishman, or because his mother was a member of the Methodist church.

"It is worthy of note that the degradation of so many English boroughs and cities during the Tudor and Stuart periods was chiefly due to the encroachment of national politics upon municipal politics. Because the borough returned members to the house of commons, it became worth while for the crown to intrigue with the municipal government, with the ultimate object of influencing parliamentary elections. The melancholy history of the consequent dickering and dealing, jobbery and robbery, down to 1835, when the great municipal corporations act swept it all away, may be read with profit by all Americans."—Fiske's Civil Government in the United States, p. 135.

"At present the disposition to run and vote for candidates according to party is practically universal, although the duty of party loyalty is deemed less binding than in state or federal elections. When both the great parties put forward questionable men, a non-partisan list, or so-called 'citizens' ticket,' may be run by a combination of respectable men of both parties. Sometimes this attempt succeeds. However, though the tenets of republicans and demo-

crats have absolutely nothing to do with the conduct of city affairs, though the sole object of the election—say of a city comptroller or auditor—may be to find an honest man of good business habits, four-fifths of the electors in nearly all cities give little thought to the personal qualifications of the candidates, and vote the 'straight out ticket.'—Bryce's *American Commonwealth*, Vol. I, p. 598.

The divorcement of municipal from general politics is something that must be accomplished before municipal officers of the proper character can be secured, and the first step towards this end must be a constitutional one granting cities complete local autonomy. Cities derive their corporate life from the state legislature; the charter of a city, under which it does business, comes from the legislature and is entirely within the control of the legislature. The powers committed to a city are strictly limited to those defined by the charter or granted by special act of the legislature. It is not to be expected that these charters as originally granted can cover, or provide for, all the requirements of cities as they may arise. The charter which would answer all the requirements of a city of ten or fifteen thousand inhabitants might not do at all for a city of four or five times that size, or even larger. Consequently, as cities increase in size, problems and wants unforeseen at the time the charter was granted, are continually presenting themselves to the administrators of city government, and when they attempt to deal with them they find they have no power to do so; their hands are tied by inconsistent charter provisions, and, strange anomaly in our democratic theory, the people wholly concerned in the matter have no power to remove such inconsistencies, but must apply to the state legislature for relief. From this condition of affairs has sprung the consequence that the bulk of legislation in most of our states has come to be nothing more than petty and inconsequential tinkering with city charters—a legislative function which is entirely outside the line of state duties. For instance, the New York commissioners of 1876, appointed to devise a plan for the government of cities in that state, reported that the legislature of 1870 passed 212 acts relating to cities and villages, which acts constituted more than three-fourths of the entire volume of legislation at that session. 808 acts, which, when printed, filled 2,000 octavo pages, were passed altogether, and of these 2,000 pages the 212 acts filled more than 1,500. It need hardly be said that the greater part of this legislation was worse than useless. This state control of city charters, besides hampering the cities by compelling them to work under defective charters for indefinite periods, or until the state legislature can be induced to change

them, tends to beget political corruption in various forms. When a city wants a new charter, or an amendment to an old one, it must maintain an expensive lobby at the state capitol for the purpose of obtaining the requisite support to carry the measure through; and the local representatives of the city must engage in log rolling, or political trading, with members from other parts of the state in order to obtain the necessary number of votes to have the city's wants enacted into law. It is not to be expected that a member from one of the rural districts of a state shall properly understand the merits of a measure relating to a rapid transit problem in a great city where he has no interests whatever, and his support for such a measure can likely only be obtained by the city's representative agreeing to support some measure in which the rural member is directly interested, of the merits of which the city member likewise knows nothing. The outcome of this political jobbery is, too often, political robbery. Schemes which involve the rankest kind of robbery of the people are foisted on the legislature by dishonest law makers and rushed through, not on their merits, but by this process of political trading. Useless offices are created and bestowed on vile creatures, solely as a reward for disreputable party service, and the people foot the bills. It is not only to secure laws from the state permitting them to act, that the cities are put to useless trouble and expense, but they must be continually on their guard to prevent the legislature from passing laws for them which they do not want at all, and which would be injurious to their welfare. The knowledge that the control of municipal affairs is vested in it has created a certain habit in most legislatures. They must show their authority every little while just to bring home to the inhabitants of cities the knowledge of the fact that the legislature has the power to control their political destiny.—God only knows for what other reason, if there is another, the greater part of legislative tinkering with city affairs by the state is undertaken—and when business gets a trifle slack they resort to charter tinkering on their own hook. In his chapter on municipal government, in Bryce's *American Commonwealth*, Mr. Seth Low speaks of his experience with this tendency while acting as mayor of Brooklyn, as follows:

"In every year of his term, the writer was compelled to oppose at Albany, the seat of the state legislature, legislation seeking to make an increase in the pay of policemen and firemen, without any reference to the financial ability of the city, or the other demands upon the city for the expenditure of money. Efforts were made, also, at one time, to legislate out of office some of the officials who had been appointed in con-

formity to the charter. New and useless offices were sought to be created, and the mayor found that not the least important of his duties, as mayor, was to protect the city from unwise and adverse legislation on the part of the state."

The length of session of our state legislatures has increased to such an extent of late years as to cause much uneasiness, and the bulk of absolutely useless legislation has reached amazing proportions. Many plans have been proposed to remedy this state of affairs. The easiest, simplest, and most rational plan would be to grant absolute home rule to cities, thus relieving the state legislatures from a great mass of business in a field where they do more harm than good, and, at the same time, the area in which political jobbery becomes effective would be much circumscribed. It used to be held that state control of city affairs was necessary to prevent corruption within the cities themselves. This was a manifest departure from the American theory of local self-government, and experience has proved it thoroughly untenable. Speaking of this theory, the New York commissioners before mentioned said that: "The notion that legislative control was the proper remedy (for local corruption) was a serious mistake. The corrupt cliques and rings thus sought to be baffled were quick to perceive that in the business of procuring special laws concerning local affairs they could easily outmatch the fitful and clumsy labors of disinterested citizens. The transfer of the control of the municipal resources from the localities to the capitol had no other effect than to cause a like transfer of the methods and arts of corruption, and to make the fortunes of our principal cities the traffic of the lobbies. Municipal corruption, previously confined within territorial limits, thenceforth escaped all bounds and spread to every quarter of the state. Cities were compelled by legislation to buy lands for parks and places because the owners wished to sell them; compelled to grade, pave, and sewer streets without inhabitants, and for no other purpose than to award corrupt contracts for the work. Cities were compelled to purchase, at the public expense, and at extravagant prices, the property necessary for streets and avenues, useless for any other purpose than to make a market for the adjoining property thus improved. Laws were enacted abolishing one office and creating another with the same duties in order to transfer official emoluments from one man to another, and laws to change the functions of officers with a view only to a new distribution of patronage, and to lengthen the terms of offices for no other purpose than to retain in place officers who could not otherwise be elected or appointed."

The arguments in favor of making cities autonomous bodies are numerous and

weighty: those against it are not numerous, and are mostly inadequate and beside the question entirely. Necessarily, it is impossible to present the municipal problem in its various aspects, within the restricted compass of an article of this character. The workmen of the state of New York are now laboring in the constitutional convention, now in session, to secure an amendment to the state constitution granting cities the right of home rule. The amendment provides that one-tenth of the qualified electors of any city may initiate the movement for a new charter. This deprives the city government of the power to block such reforms as are likely to correct their abuses and restrain their thieving propensities, and is an important provision. The amendment also provides for local option in taxation, which is a power that may be used so as to correct many municipal abuses. The home rule sentiment is fast growing and we may expect to see it put in practice quite generally throughout the country in the near future. Thirteen states have no constitutional restrictions affecting the charters of cities. Thirty states guarantee more or less of home rule to cities. The constitution of Missouri provides that any city of more than 100,000 inhabitants may elect a board of thirteen freeholders, which, within ninety days, shall return a proposed charter, which by a ratification of a four-sevenths vote at a general or special election, shall supersede all existing charters or laws. Amendments may be ratified by a three-fifths vote, and alternative articles may be voted upon. The city of St. Louis has been working under a charter formed in accordance with this provision since 1876, and it has given fair satisfaction. In the new state of Washington cities with a population of 20,000 may form their own charters independent of the legislature. There are problems to be worked out in cities of much more than local importance; they affect the very life process of the nation itself, and the first practical step towards their solution is to make our cities autonomous bodies.

## LESSON TAUGHT BY THE COAL MINERS' STRIKE.

BY MARIE LOUISE.

The strike of the coal miners, which today (June 22) is apparently disrupted—it can not be said to be settled—is replete with useful lessons and important warnings. It appeared above the industrial horizon like a thunder cloud, dark and dense. It raised and spread and cast its gloomy, foreboding, leaden bulk over more than fifteen of our mountain states. The storm broke loose and raged during two months, and, at times reached gigantic proportions. A contrary current suddenly paralyzed its course, and at present, comparative still-

ness prevails in the disturbed districts. The storm did not wear itself out, it was smothered by reactionary influence. The sky is still overcast, the atmosphere still oppressive and the spirit of man is sad.

In a special to the *New York World*, yesterday, President McBride is reported to have said that at the time he made a compromise with the operators at Columbus, "the miners were making great preparations for lawless acts. In one place fourteen cannon were secretly trained on a mine by them."

This statement shows that President McBride, in the Columbus conference, acted in accordance with his own view of the situation, and not conformably to the wishes of the miners whom he represented. To demonstrate that he lacked in thoroughness and fidelity, would be a waste of time. His conduct, which doubtless finds approbation at the hands of capitalists and lukewarm friends of labor, presents to us a lesson of great import, and ought to be the means of arriving at the solution of a problem which, in itself, is to be life or death to modern organizations of wage workers.

On the 14th of May the expressions of Mr. McBride as reported in the press of that day, were to the effect that no compromise would meet the approval of the miners. In his own words: "The old scale and no compromise." \* \* \* "We are simply fighting for living wages and there is no place for an agreement short of full justice to the men who work in the mines." The situation was clearly defined; it admitted of no equivocation. The old scale was to be won back by means of a strike.

Now what is a strike? Mr. McBride as well as all those familiar with labor organizations, knows that a strike is a war; a war whose temper oscillates between passiveness and violence as the difficulties it meets are either hard or easy to overcome.

Is a strike an act recognized as legal by our statute laws? Yes and no. Technically, it is legalized; practically, it is not. The position that a strike occupies is identical with that of all things defined and regulated by statute laws, the more you try to see through it the thicker it grows; you are looking through a bottle of ink. In an affair at law nothing is distinguishable save the clattering of lawyers' tongues and the damnable jargon they use. Laws are never meant to be understood by the people. They are meant to be a black art, to be interpreted by black robed magicians; they are meant to be a tangled enigma for the purpose of keeping people in a constant dread of having some time or other trod on one of the threads of the obscure and close woven fabric. Yes, a strike is recognized by law as a legal act, providing it sheds off all of its war features and assumes a suave

attitude of passiveness; providing its essentials be as technical as the law which recognizes it, and retains nothing of a strike but the name.

It is to be regretted that legislators have wasted any part of their valuable time to legislate into legality an act which could not possibly be illegal. The right of a worker not bound by contract, to stop working, leave his place to others and silently retire to his home, can not be disputed, and to render such act legal is like declaring with statutory pompousness that twelve o'clock has been legalized to take place in the middle of the day.

President McBride, it seems, has been able to grasp the whole extent of that which is legal in strikes. For having done that much of mental effort some laboring men believe themselves entitled to be the honored leaders of organized labor.

On the 3d of this month (June) Mr. McBride was both astonished and wrathful on receiving the news that striking miners held trains loaded with coal and sometimes used violence to accomplish this; that they made a business to persuade scabs to quit work, and did it with arguments more or less forcible; that at the approach of law officers, deputy sheriffs armed with Winchester rifles to shoot them down, they did not always run away and "get the shots in the back" as was the case with the cokers at Uniontown, Pa., on May 24. The great labor leader uttered his displeasure of the lawless acts in the following manifesto, issued on June 4th:

"There is no break in our ranks and there need be none if you keep the peace and recognize the law. The holding of trains and the obstructing of railroad traffic by large bodies of miners has resulted in not only bringing the militia into action, but in turning the tide of public opinion against us to an extent almost disheartening to us, and we say to you candidly, that regardless of the provocation you may have, such work means defeat to our cause. Hence, you must stop such work."

Below that significant and prophetic manifesto, the daily press reports:

"Mr. McBride to-day received a letter from an Indiana operator offering to make it interesting and profitable to him if he would permit the writer's mines to work, and an operator in the eighteenth Ohio district offered his influence in Mr. McBride's congressional campaign this fall for a similar favor. 'This is the first I knew I was a candidate for congress,' exclaimed the unsophisticated labor leader. He was perhaps not aware of his natural fitness to represent the people in a congress owned by capitalism, but capitalists soon discovered it. Unquestionably he would fill the place of congressman to more advantage to himself and profit to the parties in power than he does in lead-

ing the impoverished wage slaves. Instead of denouncing the miners for acts they were driven into doing, and of fawning on the operators and the ignorant public, why did he not spread all over the country the letter of the Alabama strikers which the *New York World* published on May 31st? In that pitiful, heart-rending appeal of the Alabama miners are shown the causes which made strikers desperate and resolved to get living wages or die in the attempt. Lawlessness, contempt of all justice and morality have been manifested by the operators and inflicted with impunity on their helpless victims, the miners and their families. Listen to a part of the sad story they relate:

For instance, a reduction of 25 per cent. was offered at the Johns mine, where it is all negro labor. The miners refused. Then the superintendent, Llewellyn Johns, sent the bank boss into the mines to call a meeting inside to intimidate the men into accepting. They still refused. The boss went out and fastened up the entrance to the mine, saying that the men would have to come to terms before they got out. The miners knew nothing of this until they came to the top of the mainway at knocking off time, and they were forced to return to their places of work to get tools to break the barricade. About that time the miners' wives had found out what was going on and they collected in force with tools and made an egress for their husbands. The miners never retaliated in any form, but quietly accepted the indignities heaped upon them. The next insult was an individual canvass among the men. In several instances if a man refused he was beaten with a black-snake whip, and if he ran away he was fired at. These things are spoken very lightly of by the press, but we will refer you to the executive board of the United Mine Workers of Alabama at Birmingham for substantiation. The company now have agents scouring the country for colored laborers to take the place of the regular miners. They have over 200 of them and are advertising for 1,000 more. They have some working at the Pratt mines heavily guarded by so-called men with Winchester. The miners had a meeting at Pratt to-day, having their wives and children with them. These guards notified them that they must leave in five minutes or they would fire into the children. Of course they had to go. We have no redress. \* \* \* \*

While we do not object to peace officers in their proper capacity, we certainly do not like the way all the armed force of the state are used for the benefit of the coal operators only, nor the flooding of our mining camps with the scum of the earth, acting as deputy sheriffs—the same class of thugs that Pinkerton took to Homestead—for they break into peoples' houses at all hours of the day

and night to see that the strikers are where they want them."

The simple and sorrowful appeal of which the preceding lines are an extract, was sent by the miners to the *New York World*. That paper published it under the heading: "Threatened to Shoot Children. Alabama Strikers Appeal for Justice Through the *World*." Further than that the great daily makes no comment. Had these atrocities been committed by miners on their employers the press of the county had sounded it with great blast. The violent acts of which the striking miners have been guilty were the result of great provocation; the violent acts committed by the operators were wilful and unprovoked. Yet we do not hear of a score of these wealthy law breakers being in prison cells awaiting trial, whilst hundreds of miners lie in chains and their unfortunate wives and children are thrown on the public road to die of want.

President McBride's feelings and conception of pure justice are tuned to those of the mercenary press of this country. A fight in which the two combatants have the same advantage is expected to be fair and square on all points. But when a child is pitted against a full grown man and fights for his very life, be not surprised, above all be not horrified if the child uses instruments instead of his fists. When Mr. McBride wishes to have strikers sit and wait patiently for the surrender of the operators, he must begin first by removing all surplus laborers and all class privileges. Then, and not till then, shall a fair fight between employers and employes be possible. Mr. McBride may be a great man but he is not a labor leader, let him bear this in mind. For leaders labor must have men of adamant nature, impervious alike to the seduction of gold and the scolding of public opinion; men wedded heart and soul to the disinherited class they champion.

The turn of affairs in the coal miner's strike is a chapter full of valuable lessons. It is time for the American workingman to harken and heed. In the past he complacently reposed on his belief in the individual liberty and social equality as guaranteed by the American constitution; in political rights which politicians held to his eyes as a sparkling jewel. The strikes we have had since 1887, however, give us reason to suspect that the jewel is merely a glittering bauble. The social equality and economic equity which a government of, by and for the people is supposed to realize has ended in establishing a system by which all the wealth, natural and produced, is owned by a few, whilst the toiling millions depend on their will and caprice to obtain the bare necessities of life. Remember the words Mr. Chauncey Depew pronounced, I believe at a banquet: "*To-day, fifty men can meet together and stop every wheel and every*

*wire and paralyze the entire country within the space of twenty-four hours."*

With the help of the powerful machinery which the monopolists have at their command, and with the depression in wages they are enabled to force on the laborers, over production or its equivalent, under consumption, must obtain. The result is a glutted labor market, an army of unemployed, a growing contingent to the army of tramps. How, under such conditions, can a strike confined within the limit prescribed by "law and order" have any chance of success? The American Railway Union won a brilliant victory against the Great Northern system because it controlled nearly all the employees of the 4,000 miles of tied up road. The organization was so thorough and comprehensive that no question of surplus labor paralyzed the movements of the leaders. Added to this was the stern determination of President Debs not to compromise, but to stand firmly by labor's just rights. When Mr. Hill, as a war tactic, mentioned his doubts about the representation of the American Railway Union, he met the objection squarely in the face, and answered: "If the other organizations represent the men let them set your wheels turning. The men will not go back to work. My idea is that in raising the question of representation you have sought to evade the issue. We presented the terms upon which we would return to work. I am authorized to say that we will settle on these terms and on no others." We are not informed that Mr. James J. Hill proposed to Eugene V. Debs to use his influence for his congressional campaign.

This marvelous and sweeping strike owed its great success to a solid combination of all the classes of workers engaged on the Great Northern railway. It was "a long pull, a strong pull, a pull all together." What made the failure of the coal miners' strike was the absence of a general solidification of all those willing and capable of working mines. So general a solidification of coal mine workers is perhaps not possible as is the case of nearly all other trades. This is due to surplus labor. Unless an alliance, offensive and defensive, be entered into by all the producers of the country talks of striking and "keeping within limits recognized by law" are sheer absurdities. None but a maniac would engage in so hopeless an undertaking. Not only is the capitalist, by means of his great wealth, enabled to wait until the wage worker is starved to death and is compelled to accept his terms, but, owing to the plethoric condition in the ranks of wage labor, he can continue to run his mill or his factory without a moment's stoppage. Superabundance of workers is synonymous with poverty of workers. Misery and hunger compel the

poor to work at any price, and to risk even death to do it.

Where, then, is the possibility of a strike carried on within the circumscription of "law and order," as Mr. McBride insisted that his miners should do? It is not a strike the suffering workmen are told to engage in, it is simply an abandonment of their situations in favor of other hungry toilers who rush to take their vacated places. Do you call that a strike? If it be one, pray do not dignify it with even a passing notice.

The instinct of the workingman does not mislead him. He knows to a certainty that he has the right to live by working. To his crude but sound reasoning the idea of combination of workers to defend their rights appears as a means of salvation. What fails his mind is the knowledge that strength, like all other things, exists only by comparison, and the power of their united action is available only when the resistance brought against it is not greatly its superior. You have an obelisk to raise on its base. One man cannot do it, it requires concerted action. But what must the power of the concerted action be, is essential to know. The united effort of three men cannot place the obelisk on its base. How many men, then, does it need? This is the part of reasoning which workmen neglect in their plans of organization. To defeat capitalism a force greater than itself is necessary. Nothing but the weight of all the toilers of the country united in a solid body can batter on the rugged corners of modern capitalism. All else shall fail!

On the occasion of the unsuccessful strike of the street car employees in New York a few years since, the *World* had a most suggestive cartoon. It represented a car and the conductor stepping down the platform. Below this was written "Strike!" Forward, to the front of the car, the conductor was seen lying on the ground, stunned by a monster club labeled "Capital," which a corpulent capitalist had mercilessly brought down on him. Below this was written: "Struck!"

This cartoon was a perfect rendering of the unfortunate strike it referred to, and it would be appropriate to nearly all those which have taken place since labor has taken to the notion of tickling capitalism in the ribs. The coal miners have also been struck, but with this difference for the better that they stood before their foes in an erect attitude and showed a desire to hit capitalism on the face instead of tickling it in the ribs. They have written the first page of American history where an emeute of labor has raised to the dignity of an insurrection, where the blood of the toilers has consecrated the right of labor to be free and honored.

### LOSS OF EFFICIENCY IN CONDENSING ENGINES.

The standard of efficiency which has been adopted, is the range of temperature—the absolute temperature and while this has never yet been accomplished in actual work, and probably never will be, it remains a standard by which we may compare any engine, condensing or noncondensing, simple, or compound, or otherwise. The efficiency of the engine may be greater or less, according to the way in which steam is used, or worked, and those conditions are mainly dependent upon the mechanism. It has been found that there is no gain by increasing the ratio of expansion beyond a certain limit, and while this would appear strange it remains a fact, the various reasons exist which prevent any gain when the expansion is carried beyond a certain point. Up to this point the losses of heat by back pressure don't change much in their ratio to the power exerted or steam used, but past this point the misapplication of heat during expansion and a little excess of back pressure both *rapidly increase* as the ratio of expansion *increases*, and we should remember under ordinary circumstances a gain in expansion becomes more than balanced by the increase of loss in the two factors named. Another curious fact in connection with the efficiency of steam from a theoretical standpoint, is, that a condensing engine is not capable of utilizing quite so large a percentage of the theoretical heat as the noncondensing engine under similar conditions, comparing both with a perfect engine and making all allowances for clearance, wire drawing, loss of expansion, etc.

The conditions of practical economy resolve themselves then into several factors, some of which we avoid and some of which are misleading, others are unavoidable, that is to say, with the present mechanism and our knowledge we are not able to avoid certain losses and others we may avoid to a certain extent, so that we have avoidable and unavoidable losses, and it has been found, in many cases where the practical economy is considered, that the usual condensing engine really utilizes more than 40 to 50 per cent. of possible heat, and under many conditions of actual cases really less than that; in the noncondensing engine the apparent efficiency is found greater, because some of the losses in efficiency are less in the condensing engines, so that the relative efficiency as compared with the theoretical, or ideal engine, is greater under

certain conditions and in practical use; as we are discussing the locomotive more than any other engine, it is well to note these facts, for the locomotive is unavoidably noncondensing, and whether simple or compound, it is not necessary to consider. The main point, which we are considering is what underlies the whole structure of steam engineering, viz: That the transfer of heat is unavoidable from the very nature of the process of converting it into work in the engine itself; if we could only combine a refrigerating apparatus with the locomotive then we should have a gain by the transfer of heat—expansion, but as this is an impossibility we must make the unavoidable losses as small as possible in any heat engine, and thereby accomplish as much of the theoretical as possible. If we convert a certain percentage of heat into useful work, that stands to the credit of "for useful work done;" on the other hand we have several losses to charge in the account, and these are practically as follows: *First*, in heating feed water; *second*, the loss during expansion; *third*, the loss of uncompleted expansion; *fourth*, the loss in excess of back pressure; these last four items of loss frequently making up 60 per cent. of the available heat, sometimes more than that; one of the largest terms in such computations is the loss of incomplete expansion, it sometimes rises as high as 30 to 34 per cent, the back pressure is really less than 6 per cent., while the "loss during expansion" frequently rises as high as 5½ to 6 per cent., while under good conditions the heating the feed water is really less than 7 to 7½ per cent., this refers to good condensing engines. In a case of this kind recently cited where the engine was worked with an expansion of about 7 times, using 70 pounds pressure, the condenser rising to 102°F., or with exceedingly little back pressure, the total loss of the available heat was 41.2 per cent. while that realized was 58.8 per cent., and this was considered an exceptionally good showing. The elements to be considered are the temperature at which the engine receives the steam, and the other element is the rejection of the heat. If the heat is rejected at 212°F. or higher, as it frequently is in the locomotive, the percentage of heat realized or work done is considerably diminished, for the higher the temperature of the steam as it is rejected from the engine, the lower the range of temperature between its receipt and rejection, and it does not make any difference what the ratio of expansion is, the accuracy of the cut-off, or the position of the link, or any other usually considered factor. The absolute measure of efficiency is the range of temperature between the steam admitted into the cylinder and that passed out of it as compared with

the absolute temperature. This feature is often lost sight of, and the same thing holds good with reference to any engine, whether condensing or noncondensing. It is true that many other factors enter into the calculation, but that which is given is the point from which all efficiencies of account are finally figured.

If it were possible to send the steam into an engine at its highest pressure, which would consequently be its highest temperature, and to reject it at the very *lowest*, then the range, as compared with the efficiency, would be *high*, but circumstances which we cannot control cut down the temperature of admission, or by reason of valve ports and other controlling devices, which wire-draw the steam, hence we do not realize the highest temperature but some other one. Before expansion commences the steam-valve is partly closed, the pressure is reduced a little, a slight amount of superheating may take place but the real efficiency is not increased, and a loss takes place from misapplication of the heat. If it were possible to introduce heat into the cylinder of the locomotive at 375°F., or 185 pounds, and reject it at 163°F., or 5 pounds, which would be practically a vacuum or 10 pounds per square inch, the efficiency of that engine would be *very largely increased*, but as it is, we really enter the steam at from 350 to 360°F., and more frequently exhaust at 220°F., or about 2.2 pounds above the atmospheric line. This makes a wonderful difference in the efficiency of an engine, provided the steam has been economically made.

In a recent trial of a condensing steam engine with a purpose to get at the absolute facts, it was found that a loss of 40°F. was taking place between the discharge of the condenser and the external air, and this loss upon computation was found to be very nearly one-half the work done by the machine, that is to say, it was found that if the 40°F., which was afterwards done, was entirely put out of the way, and the condenser was delivered at 60°F., which was the temperature of the atmosphere rather than 100°F., which was the fact in the first case, and it required near half a horse power less than before, in other words, the thermal units wasted from each horse power each minute by a lowering in the temperature of the condenser of 40° was a loss of very nearly one-half of each horse power per minute.

One of the most important losses arising from the fact that the fluid does not expand steadily through the whole difference of pressure, thus it might otherwise be said that it does not all do useful work, but the old problem of energy thrown away on what we are not yet able to stop is one of our unwelcome attendants. The extent to

which this is carried in some of the engines is a larger part of the whole than is desirable, and with a link motion, where the valve is moved positively, it becomes a source of more loss than in the automatic, or cut off engine, and it is due to the peculiarities of the slide valve moved by a link that one of the most annoying sources of loss is encountered; the motion is slow in its closing, all the while it is dragging on its way to close, it is "drifting" in steam, this raises the expansion line and reduces the actual expansion as well as increases the condensation and materially changes the computations as to the work of the cylinder as to its effective work, whether alone or in series with others.

All these matters add to the difficulty of overcoming the natural features of the single valve engine, or in a place where one valve is expected to act in a variety of ways, and to accomplish many separate functions, to admit, carry, release, cushion, as well as change its lead by the link, and so shorten or lengthen its admission, and otherwise be in several places at once, so far as accomplishing its work goes.

If someone can perfect a valve that will act on its steam line (admission), so as to carry steam to any part of the stroke, called for by the change of grade or load, using the whole pressure of steam for any length of the stroke, not choking down, we shall have one of the most important of the whole desirable steps toward the final putting the locomotive on the basis of a steam saver, not a steam chews.

Some of the recent literature on the new improvements in the locomotive would seem to have a sinister motive, or to impute ignorance to those who were to read the peculiar and one-sided statements put out, and it needs some of the factors referred to in this article to be considered.

The demand for more economy in all parts of railroad management, aside from the salaries of the head men and the friends of the large stockholders, it may in time arrive at some reward to the man who can discover a way to do more work with less coal, to the extent of allowing him to earn forty dollars a month if he will give to the road the benefit of his invention?

Thos. Pray, Jr.

We are almost daily in receipt of letters intimating that the writers have had an offer to go to Brazil or other South American countries, and asking our advice about going there to run engines. From all we can learn it's a poor place to go to; wages are no better there than here, money of the country depreciated and climate undesirable. We do not believe that any reliable firm are contracting with men to go to those countries.—*Locomotive Engineering.*

## More About Braking.

MR. EDITOR:—In answer to Mr. Droney's questions in the June MAGAZINE, I will say that there is more pressure in the cylinder having the three-inch piston travel than in the one having the seven-inch, because of the smaller space for a given volume of air. There will not be more pressure in brake cylinder than in auxiliary from an emergency application, as the shorter the piston travel the less the space for train line pressure; as there is but three-inch travel the space will be ten by three inches, and this space only gets a per cent. of what is in train line, and being entirely empty to start with, it is the auxiliary pressure that will equalize in brake cylinder, as that which came from train line is of less pressure than the auxiliary. On this same principle Mr. Droney can reduce his piston travel until he gets it down to the thirty-second of an inch, and then ask some one if, in an emergency application, there would not be 85 or 90 pounds brake cylinder pressure from 70 pounds train line and auxiliary. And on the same principle water will run up hill without assistance. Volume and space are the main features in this case.

Mr. Ogden has not given a satisfactory answer to my question in the May MAGAZINE. He has started across the river and fell asleep on a sandbar, and thinks he is safe, but one of these days the water will wake him up, and it will be swift and wide.

BIRMINGHAM, ALA.

J. J. Harrell.

## Questions and Answers.

The following questions and answers have been clipped from *Locomotive Engineering*:

S. G., Fall River, Mass., writes:

What is the answer to questions 14, 21, 23 and 25, Chart No. 1? A.—Question 14 reads: "How would you place piston and valve if disconnecting a mogul or ten-wheeler, where side rod pin would strike cross-head key if it was blocked in center of guides?" This was put in to call attention to an often forgotten point. The answer is obvious. If the front side rod pin struck the key when cross-head was in the center, it would be necessary to block the cross-head forward or back, and if forward move the valve forward, and *vice versa*; the pin might strike the key if it was forward or back; this point should always be observed. Question 23 reads: "What could happen that would cause you to disconnect without covering the ports?" We will answer this by asking another. What good would it do to cover the ports if the steam chest cover was broken? Question 25 reads: "Does it (the piston) stop at each stroke? When?" Yes, the piston stops at each end of the stroke.

S. G., Fall River, Mass., writes:

1. Am running a mogul; drivers are equalized to front truck by usual long equalizer with a hanger coming from back up to a cross lever between the ends of the front driver springs. Should I break this long equalizer or center pin of pony truck, how should I block up? A.—Raise engine in front and block between the cross equalizer and the boiler, or between the long equalizer to truck and the cylinder saddle. 2. If truck wheels are solid cast iron plate wheels, and I break out a piece or a piece of flange how can I block wheel to slide? A.—This is a case for horse sense and judgment. Probably by blocking a piece of wood or a tie between the broken piece and the frame, or some other stationary part of the truck. 3. What kind of a clamp would you recommend for holding disconnected valve stem where metallic packing is used? A.—A strip of iron  $1\frac{1}{2}$  inches wide,  $\frac{1}{4}$  inch thick, with a slot in it for the key, and carried back, bent and punched to go over one or both of the gland studs. It must be the right length to hold the valve in the center of the face of the seat.

M. T., Port Jervis N. Y., writes:

There is a difference of opinion between different parties in this vicinity as to the construction of a deck engine and a foot-board engine. Please advise in your next issue how a foot-board engine is constructed, and also how a deck engine is constructed. A.—We do not that there is an established rule in this matter. In Europe the platform behind the boiler-head (in this country called a "deck") is called a foot-plate. In this country the word "foot-board" was once used to designate the same thing, and some still call the "running-boards" ahead of the cab foot-boards. If we were the court of last resort in this case (which we are not) we should say that an engine having the boiler extending through the cab and where the engineer and fireman stand on an extension of the running-board, which becomes the cab floor, was a "foot-board" engine; and one with a short boiler-head and an open deck between the men and back of the boiler head (like the ordinary soft coal eight-wheeler), a "deck" engine.

J. R., Grand Rapids, Mich., writes;

In running different engines I notice that injectors placed about on a level with top of tank run with less noise, have greater range, start quicker, not so liable to break as those high up on boiler. Now is not the velocity greater when the lift is 1 foot than it is at 25 feet? If velocity, vacuum and steam pressure are the main points in the successful working injector, why place it so high? If it takes all the power to raise water say twenty-five feet, what's left to

force it in boiler? And this climbing up and down every time to start or stop it is not pleasant. A.—A whole chapter might well be written on the outrageously unhandy location of injectors; they ought to be so located that a runner could handle them without even taking his head inside the window let alone getting off his seat. Every inch of extra lift decreases the capacity of any injector, and adds a straw to the load of possible failure, affects the range, and causes the instrument to make more noise.

J. J. Jones, Hanover, Kan., writes:

1. Why can a person skate over ice so thin that it would break almost instantly if the same person were to stand still on it? A.—Thin ice may be crossed quickly because it is supported by the water, which is quite dense, and moves from under the ice and the skater slowly. The ice and water do not have time to get out from under him. 2. How can you get a 75-ton engine over a bridge constructed to carry only a 50-ton engine? A.—Strengthen the bridge. These questions are doubtless raised by one who believes the common fallacy that an engine running very fast over a bridge does not put the pressure upon the structure due to the full weight of the engine. Exact engineering measurements have proved that there is nothing in this theory.

#### Train Signalling on English Railways.

Judging from reports that have recently come through our English exchanges there seem to be on English railways much difficulty and many accidents on account not of defective signalling apparatus but of lack of intelligence or over work on the part of the operators. In two very recent instances accidents have occurred from allowing two trains to enter the same block in direct violation of regulations. In relation to a third accident, however, *Transport* thus details the duties of the signal man at the point where the accident took place:

Here a careful and well-conducted man has charge of a cabin. It contains "forty-seven levers in use, besides block instruments for the up and down 'slow' and up and down 'fast' lines to and from Bodleys, six toll-tale instruments for the lines through the station, six electric route indicators, six electric starting indicators, a telephone, and a speaking telegraph instrument." Add to the curatorship of this museum of apparatus the obligation to see each train entered in the book five several times; add further a dense fog, and the sudden arrival of "three fogmen to have their tickets filled in;" and the wonder is, not that Cleaver "became confused, and did not clearly know what he was doing," but that any one should be expected to keep

his head and do everything according to the proper routine. And really, if the 47 levers and 24 instruments fail, unless worked by archangels, to protect the 402 yards of line between Bridgeman Place and Bodley's cabins, it does seem a pity to spend on them money which comes not from the clouds, nor even out of the pockets of bloated share-holders, but simply out of the pockets of the customers of the railway.—*Railway Age*.

FROM a report to the board of trade it appears that the number of persons killed and injured during the past year on British railways was: Passengers—from accidents to trains, rolling stock, permanent way, etc., killed 17, injured 484; by accidents from other causes, killed 89, injured, 737; servants of companies or contractors, from accidents to trains, rolling stock, permanent way, etc., killed 10, injured 73; by accidents from other causes, killed 450, injured 2,558; persons passing over railways at level crossings, killed 55, injured 30; trespassers (including suicides), killed 360, injured 135; other persons not coming in above classification, killed 30, injured 92. Total killed, 1,011, injured 4,109, showing a decrease on the totals of the year 1892 of killed 119, injured 376.—*American Machinist*.

THE award of a contract for sixty locomotives by the directors of a Brazilian government railway to the Brooks Locomotive Works of Dunkirk, N. Y., is an event of great significance. It is not only highly complimentary to the manufacturers, whose products have long borne a high reputation, but it is encouraging evidence of the ability of American establishments to compete in foreign fields with nations which have hitherto largely monopolized those fields. The event is also another indication that the World's Columbian Exposition is bearing fruit, as the engines are required to be of the design shown in the fine exhibit of the Brooks Locomotive Works at the great fair. It is stated that the order will amount to nearly \$750,000.—*Railway Age*.

ONLY one railway in North Carolina paid a dividend for the last year, and that one is a local road, the Atlantic & North Carolina, less than one hundred miles long. The great systems which do the through business and seek the favor of the public by fast trains, magnificent cars and extensively advertised resorts are all in bankruptcy, while the little "plug" road, removed from the expenses and dangers of competitive traffic by its isolation, and able to charge reasonable rates for its services, makes money for its owners. Meeting the rates and equaling or surpassing the extravagances of competing lines are the principal causes of railway ruin.—*Railway Age*.

HON. L. S. COFFIN, whose "white button" total abstinence movement is doing a great work for railway men, writes to the *Iowa State Register* from Pittsburgh, Pa.:

I doubt if ever in all the history of temperance reform there can be found its equal. It is but two years ago the first white button has been put on and now already over 110,000 have been given out and they are being worn by these men in every state and territory of this union, in Canada and Mexico, where the whistle of the locomotive is heard. There seems to be a determination among them to make the thing unanimous. I have been here now nearly a week speaking every night and two and three times on Sunday. The boys are forming local organizations all around and on the first Sunday and Monday of July there is to be a delegate conference here to complete a National Railroad Temperance association of the white button. I leave here for Trenton, N. J., where between Saturday noon and Tuesday morning next I am advertised to make not less than eight addresses. The following Saturday and Sunday about the same work is laid out for me in Columbia, Pa. The work is spreading wonderfully.—*Railway Age*.

The engineer who is installing the electric power plant for the new Metropolitan Elevated railway in Chicago figures that the use of electricity will save that company \$300,000 a year in operating expenses, compared with the cost of running trains by anthracite-burning locomotives. The saving in fuel alone by using soft coal in stationary boilers instead of hard coal in locomotives is figured at \$200,000, and the difference in salaries if high-priced engineers had to be employed for each train, with other economies which electric power will give, are expected to amount to at least \$100,000 a year more. If experience demonstrates the correctness of these estimates the steam locomotive will have received another serious setback.—*Railway Age*.

The Guion steamship company has decided to sell its ships and go out of business because it does not pay to carry across the Atlantic wheat at a penny a bushel or other freight at twenty cents a ton. There are several railway companies in the United States that would like to go out of business also, for similar reasons, but unlike the steamship owners the bulk of their property is not of a movable character. The ship owners may seek new routes of business, but the railway cannot be moved and it cannot be abandoned except at total loss of the investment. And because railway property is fixed the communities in which it exists should not take advantage of the fact to treat it unjustly.—*Railway Age*.

#### Excursion Ticket for the Corpse.

While an excursion train to Alabama was waiting at the depot a negro appeared at the ticket window and purchased a ticket for himself. Then he said to the ticket agent:

"Boss, I want 'nuder round trip 'scurtion ticket for a corpse."

The agent opened his eyes in astonishment. An excursion ticket for a corpse was something new to him.

The negro explained: "You see, boss, my brudder died yesterday, and I want to take de corpse down to Montgomery and let the family view the 'mains, and den bring 'em back to Birmingham and bury him. Dis will be a heap cheaper den fur de family to come up here."—*Marietta (Ga.) Journal*.

THE Chicago & North Western makes a very good showing for the year ending May 31 last, considering the condition of railway business generally. On the 4,273 miles constituting the North Western proper the earnings were \$31,971,885 against \$32,709,747 last year, a decrease of only \$737,862. The expenses, taxes, interest and sinking fund aggregated \$27,694,157, a reduction of \$1,003,575, and after paying the regular dividends of 7 per cent on preferred and 6 per cent on common stock, aggregating \$3,906,594, there remained a surplus of \$371,133, against \$873,148 last year. Few, indeed, are the railway companies that have stood the storm of financial disaster like this; and few are the companies which have so magnificent and homogeneous a property under so able and tried a management.—*Railway Age*.

#### Great is the City of Manchester.

Manchester's name is well known by reason of the great ship canal which her men of enterprise and nerve built. But that one great work is not all she did or is doing. Here are some of her recent expenditures: Ten million dollars for a water supply, \$3,000,000 for better drainage, \$2,500,000 for improved gas works, \$750,000 for an electric light plant. The result of all this is Manchester's general prosperity. The canal is the crowning work of all, and the results are marvelous.—*Baltimore American*.

SOME of our contemporaries are standing up on their hind legs and howling about the Coxeyites. It seems to us that the Coxeyites are very much like the green bottle fly, not so awful bad in themselves, but indicating the presence of a carrion somewhere—where? That's the question the American people must answer.—*Locomotive Engineering*.

## WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER.

Letters for publication should be directed to Mrs. Ida A. Harper, Stanford University, California.

### BRIEF SKETCH OF STANFORD UNIVERSITY.

The Leland Stanford Jr. University has just celebrated its third commencement with over sixty graduate students, of whom thirteen are women. Any skepticism which might have existed in regard to the success of this great new university, in this comparatively new country, is shown by this time to be unfounded. During the present year one thousand students have been registered. There are only four states which have not sent representatives. A little over one-half of the students are residents of California, but, as comparatively few of these are native born, the student body can by no means be considered typical of this state. The cosmopolitan character may be understood by the fact that there are nearly forty students from New York state and about thirty each from Indiana, Illinois and Iowa; far-off Maine and Massachusetts contribute five students each; Canada sends fourteen, Japan eight, Hawaii seven, Brazil, Germany, Denmark, France, Italy, Russia, Scotland, England, Ireland and Mexico all have creditable representatives. There is one negro student in attendance.

About three hundred of these students are women, and there is, perhaps, no university in the country where their equality is so fully recognized. This is due, in a large measure, to the fact that the president and faculty are all in favor of co-education, and set the example of treating the girls with the highest respect and consideration. In many of the classes women are given the most desirable seats by common consent, and I have frequently seen a professor stop after he had commenced his lecture to see that girls were provided with seats. If there is any discrimination or partiality shown by professors it is in favor of the girls. I have been told repeatedly by different members of the faculty that they got the most careful and conscientious and, in many instances, the best work from the girl students. The ablest paper during the year on constitutional history was prepared by a girl under twenty years of age. The ablest botanical thesis, prepared from original investigation, was written by a lady student. The prize story of the year was written by a girl eighteen years old. The senior farce was written and put on the stage by a girl of twenty. At an important election one of the girl students went in with one hundred and forty proxies and se-

cured the coveted position over the male competitors. The girls have a membership in all the clubs and societies that they care to join, they hold office and they have a vote in all elections and on all matters that come up before the students. These privileges are not due to the much exploited California chivalry, as there are only one or two California men on the faculty, but they are simply the result of the broad, liberal spirit of the university, which expresses itself in every department and in all the various phases of the college work and life.

The situation is unique. Here we have, placed in the center of the largest stock farm in the world a great university, equipped with fine laboratories, libraries and all the modern appliances for the higher education; a faculty selected from the best colleges of this country and Europe; students gathered from all parts of the world, and all of these shut in by mountains, isolated from the rest of mankind and leading the most primitive life imaginable. Great troops of beautiful horses come racing down to the fence and look over as if they would say, "What are these people doing in our domain? They don't look like blooded stock." On this side of the fence we have poor students of fine mental caliber, burning the midnight tallow candle and subsisting on scraps in their struggle to reach a higher life; on the other side of the fence, petted and coddled by a retinue of servants, a piece of horseflesh with a market value of \$150,000. But the poor student is not worrying over this discrepancy. He finds his inspiration in the thought that the president and some of the most distinguished professors in this great university "worked their way through college," and this recollection gives brilliancy to his little candle and savor to his humble food.

Senator Stanford reasoned wisely when he placed his university among the groves and fields. Owning property from one end of the state to the other, he selected what was to him the most cherished location of all, the site of his own home and the tomb of that sole representative of his house, destined to live only in this memorial institution. Stanford University is situated in the heart of the exquisite Santa Clara valley. The foot hills commence their ascent at its very threshold and rise in magnificent oak-crowned terraces until they are lost in the long line of mountains that touch the western horizon. On the east is an arm of San Francisco bay and, rising up from its shores, the rugged coast range, on whose highest peak, as we look toward the south, we see the famous Lick Observatory. On one side of the University is a lovely fresh water lake much enjoyed by the boat clubs, on the other is the famous arboretum, covering many acres and containing trees from

all the countries of the world. At its entrance is the large museum with its fine collection; up one of the long drives is the elegant Stanford mausoleum. In the distance rise the gables of the handsome Stanford home, now occupied by its one solitary owner. In a cluster of magnificent oaks is the home of President Jordan, and now we are on the college campus. Here is the boys' dormitory, said to be the finest in the United States, erected at a cost of a quarter of a million dollars; the girls' dormitory, the professors' houses, a few boarding houses and some very pleasant private residences, a little community of perhaps fifteen hundred souls, living a purely literary life, afar from all the world's distractions, entirely dependent upon each other for social pleasures. There are no factories, no theaters, no saloons, no stores, no stables, no loafers, no tramps. A mile away is Palo Alto, two miles away Menlo Park. Once a day the grocers', butchers' and milkmen's wagons come clattering over with the necessities of life; Chinamen with their heavy paniers of fruit and vegetables go trotting about from door to door; every day in the year carriage loads of tourists bring us a momentary reminder of the far-away outside world, and then pass out of our existence and memory forever.

There is a peculiar charm about this primitive life. It has not the dead monotonous level of ordinary country living. We are in daily contact with the great minds of the past and present. We have scores of lectures every day in the week such as people in cities gladly pay a dollar for and only can have occasionally; we have books by the thousand and time to read them; we have geological and botanical excursions into the mountains and fields; we have ideal Sunday services in the pretty chapel, with the doors wide open and the air full of perfume and the song of birds, and the best ministers that the different cities can send us; we have our own brass band and string band, mandolin clubs and glee clubs. The most important exercises are held in the big gymnasium, which is transformed into a bower by great branches of broom-tall palms, pampas plumes and thousands of roses; and here, also, the young people dance with an enjoyment that is an utter stranger to the crowded and heated city ball room. If this simple, healthy life palls upon us, an hour's ride by rail takes us to San Francisco, where may be had all the best and all the worst afforded by any large city in the country.

It will be seen that the opportunities here for earnest, systematic study are unparalleled, and the statement is often made that there is not such hard and incessant work done at any other university in the country. The elective system, which is

very fully carried out, enables the student to select the branches that he loves, that it is a pleasure to study and that he expects to make practical use of in after life. The credit system gives him an opportunity to make every hour's work count in the necessary amount to secure his degree, and stimulates him to greater effort than where four full years are required, no matter how great the proficiency. The seclusion here and the entire separation from all the distractions of outside life are a most potent factor in enabling the student to give the best of himself to his college work. This also has the additional and even more important effect of securing an exceptionally fine *morale* among the students. The standard in regard to the vices common to college life is far above the average. The greatest incentive to work, however, is found in the fine, stimulating atmosphere and the absolute purity of the air. We are too far north for the tropical heat and languor, and the air blows fresh and untainted from the sea and the mountains, giving one an energy and buoyancy that must be guarded against or they will make him forget the necessity for rest. Possibly this may be one reason for the exceptionally fine record the university has made in athletics.

The architecture of the buildings, which have already cost a million dollars, has been many times described. They are constructed of yellow sandstone, roughly hewn, with pillared porches after the Moorish style, enclosing a quadrangle of between three and four acres. By moonlight the scene is more beautiful than the imagination can conceive, and it is the best loved picture in the memory of the student after he has gone back into the prosaic world.

#### ON THE PACIFIC COAST.

CORONADO BEACH, CAL., June, 1894.

The imagination cannot conceive a fairer picture than lies stretched before me as I write. I wish that I could put it into words, so that our readers might share, in some small degree, at least, the pleasure it affords. Coronado Beach is the name given to a long, narrow, curved peninsula that juts out from the extreme southern end of California, holding in its hollow San Diego Bay. Here are a number of fine residences and pleasant grounds; but the distinctive feature of the place and the one which has given it a world-wide reputation, is the magnificent Hotel del Coronado, located on its very tip, its spacious grounds washed on one side by the bay, on the other by the great billows of the Pacific ocean. I do not know of any place that more strikingly illustrates the wonderful possibilities of California soil and climate. Six years ago this spot was a barren, sandy waste. It was purchased by a party of capitalists, who

planted and watered and cultivated, and now there are groves and hedges and acres of grass plats, lofty palms, fertile gardens and myriads of blooming plants. When I was here two years ago, I said if tourists could see but one spot in California it should be this, and a second visit confirms the opinion.

The fact of the place being so easily accessible makes it especially desirable. One may have an early evening dinner in San Francisco on one day, and a late evening dinner here on the next day. The Southern Pacific railroad carries the traveler through the beautiful and fertile San Joaquin valley, where, for many miles, he looks out on the broad waters of San Francisco Bay. The next day he passes through much picturesque mountain scenery, including the famous "loop" in the heart of the mountains, where the train crosses and recrosses its own track and even goes through a tunnel beneath it, in its effort to climb the steep sides of the mountain. And then, when he is hot and dusty and tired and cross from his ride through the desert, he gets off at Mojave, in the very center of it, and finds a meal which is beyond criticism, and is given plenty of time to eat it. This puts him in a good humor and he is ready to enjoy the few hours spent at Los Angeles. This is the second city in the state, in size, and it is much handsomer than San Francisco. Its business blocks would be a credit to any eastern city. It has sixty miles of cable and electric cars, many miles of paved streets, and its private houses and grounds are beautiful as one would imagine Paradise. As we stood at the entrance of some of them and looked in at the exquisite foliage, the fountains, statuary, flowers, and elegant and stately houses, I said, "It seems as if there could not fail to be perfect happiness amid such beauty." And a wise young girl, who was with me, said, "Well, even I have lived long enough to know that there may be the greatest happiness in very humblest surroundings." I had to admit the truth of this, and, indeed, it is what helps reconcile us to the terrible inequalities of life, as regards material things. If there were no happiness without wealth, we would be ready to follow the example of Job, who was ready to "curse God and die." While it is hardly possible to be happy in the midst of extreme poverty, where the struggle for the necessities of life is bitter and unending, yet observation will show that the largest happiness and contentment lie in the "golden mean," among what are called our middle classes. We find here the greatest sobriety and morality, and it is to this division of society that we must look for the finest type of the men and women of the future.

To come back again to this cool, shaded

veranda, where I write, covered with climbing roses and honey suckle: The large interior court is a great bower of tropical bloom; the fuchsias and heliotrope climb to the second story; rose trees and azaleas are bending with blossoms, the whole is surrounded by a brilliant border of pinks and nasturtiums and geraniums, while near the fountain, in the center, are perched bright plumaged paroquets completing an ideal picture. Across the bay, on a long stretch of sandy hills, lies San Diego. A far off, where the shadowy line of mountains melts into the horizon, is old Mexico. But most beautiful of all, the one thing of which one never tires, is the illimitable ocean. It rolls in to the very steps of the hotel. The large dining room, which seats 1,000 guests, overlooks its sun-kissed waters; the great circular ball room overhangs its rolling billows and the music blends with the roar of the surf. From the beautiful parlors the guest steps out on glass enclosed verandas, where he may view the magnificent spectacle, sheltered from every breath of wind, or he may walk forth on the grassy terraces and, in a rocking chair under the palm trees, watch the distant sails, the sentinel light houses, the blending of sea and sky, or he may stroll down on the long, white beach, where the great, curling billows roll their white foam up to his very feet.

What an idle, useless life one leads in a big hotel. The important work of the world never has been, never will be done by people who abide in hotels. The life is enervating, it destroys activity, it takes away self-reliance. Existence resolves itself into touching the button and letting somebody else do the rest. We get through breakfast at 10 o'clock, read or write letters till 11, go for a salt water swim till 1, dress for luncheon; afterwards lie down and rest (?) awhile, make a careful toilet for dinner, spend an hour at the table; then sit in the moonlight and enjoy the magnificence of the ocean, as its mighty breakers dash upon the shore; then wander into the ball room and listen to the orchestra and watch the dancers; then stroll into the billiard parlors or linger at the whist tables and observe the players, and then, at midnight, go to bed, conscious of having accomplished nothing all day long. Such a life, day after day, cannot but be demoralizing, and yet, for those who are busy every moment of ten or eleven months in the year, it is a welcome relaxation, an enjoyable change, and it will have no injurious results. We go back to work with a relish, and our plain, simple existence takes on a new zest because of the contrast it affords to the butterfly life of fashion and frivolity, which no normal, well-balanced man or woman would wish permanently to adopt.

The Southern California railroad offers

such a wealth of interesting and delightful resorts that it would be almost an impossibility even to touch upon them. Its peculiar "kite-shaped track" includes a greater range and variety of scenery than any road of the same length in the country. It spans the four most beautiful valleys of Southern California and carries one by the sea side, over the mountains, through orange groves, past canyons, and waterfalls and parks and old missions, a bewildering array of interesting places. Before the close of summer we expect to visit a number of these inland and seaside resorts and I hope for the pleasure of recording some of their most attractive features, thinking they may possess an interest for those of our readers who may not have the privilege of visiting them. Strong as was the desire to return to the friends and kindred in "the east," I could not resist the opportunity to travel over this wonderful state, whose resources seem even more remarkable as one learns to know them better.

#### EDITORIAL NOTES.

Oscar Wilde, the apostle of the sunflower, says, "I like to detect intelligence in men; I don't like to find it in women. Their mission in life is to be beautiful—that is all." This is not the first silly thing that Oscar has said, although people who read his writings say they sometimes detect some intelligence in them. The three or four million women in the United States who have to work for a living might be able to support themselves by their beauty, although there is a possibility that the market might be overstocked, but unfortunately the beauty was left out when a large number of them were created. The most of them, therefore, cannot fulfill their mission but must "hustle" to make an honest living, the same as Mr. Wilde does. They say, by the way, that he is the homeliest man in London. Some men seem to have a mission to dodge the foolkiller, and it is wonderful how long some of them succeed in doing it.

A Miss Fleury, M. D., has been made clinical assistant in one of the Dublin hospitals. This is said to be the first public appointment ever given to a woman in Ireland. The Austrian government has appointed two women physicians in the province of Bosnia, both graduates of Zurich, Switzerland. Until now women have been steadfastly refused permission to practice medicine in Austria. In Afghanistan, in the very heart of barbarous Asia, the Ameer has appointed an English woman physician in the palace. Let us hope the time may come when there may be no corner of the earth where a woman may not have a physician of her own sex, if she so desire.

In a recent report Carroll D. Wright states the total number of building and loan associations in this country to be 5,838, with 1,745,725 shareholders and \$450,667,594 net assets. The average age of these associations is six years, the great bulk of the shareholders are wage earners, and the number of homes that have been built through them is 314,755. This offers great encouragement to the thrifty, and disproves some of the arguments that are made to show that it is impossible for the workingman to save enough for a home. It would be interesting to know how much of this stock is owned by women. They are noted for their prudence in small savings, and their names are on the books of all the building and loan associations in the country.

The New York Constitutional Convention has not yet, at this writing, taken up the subject of woman suffrage. Miss Anthony who had gone to Kansas to assist in the campaign there has been recalled to Albany, as the situation there is considered more precarious. Although the movement has received the support of a number of first class papers and many prominent people, it is very doubtful if there is a sufficiently strong public sentiment to secure the desired amendment. The *Review of Reviews* is authority for the statement that nine-tenths of the delegates are opposed. The permanent chairman, Joseph H. Choate, is in favor. The campaign has been one of education and its effects will not be lost.

It is estimated that in the whole of Europe over 600,000 women hold public appointments. Women are very largely employed in the post offices, telegraph and telephone offices, savings banks, and very extensively by the railways as station agent, clerks and even at switching and flag stations. France, which is considered very conservative in many things, is noted for the large number of women employed in public capacities, between five and six thousand in the post office alone. The completed census of the United States, doubtless, will give some startling statistics as to the number of women in business in this country.

The board of health of Orange, N. J., is considering the advisability of issuing a circular suggesting that women wear their skirts sufficiently short to clear the ground, in order to avoid contagion and the spread of disease by sweeping up the filth and disease germs. One would think it might occur to these Solons to sweep and clean their streets, so that it might be safe for a woman's skirts to touch the ground. But the city council of El Paso, Texas, think differ-

ently and they have passed an ordinance that no woman shall walk or ride on the streets of that city wearing what is known as the "divided skirt." It seems as if the women of El Paso would want some official voice themselves in this matter, and would object to having a body of men regulate by law the cut of their skirts. It is almost the universal opinion of physicians that the sidewise position of a woman upon a horse and the heavy and awkward riding habit are positively injurious. Expert bicyclists all agree that, for a woman to ride the wheel with speed and comfort, a divided skirt is almost a necessity. There is a growing sentiment everywhere that women who are obliged to go on the streets in rainy weather should have some sort of a costume that will do away with the wet and dragged skirts which are so detrimental to health and comfort. Just as women are beginning to struggle out of this bondage, the city council of El Paso rises up and proposes to prosecute any woman who runs a seam up through the middle of her dress and divides it into two parts. And when these idiots run for office again, the women of El Paso will all sit at home with folded hands and let them have it.

The cold facts are very apt to freeze out our pet theories. The last census shows that, instead of all those superfluous women we have heard so much about, there are in the United States 1,422,410 more single men than women. It is a real comfort to know that women are not "dreg in the market," and that if every last one was married, there would still be a million and a half men with no one to take them in out of the wet. It is the men who are superfluous, and the women are finding this out every day. The census only confirms officially what they have been thinking privately for sometime.

Miss Olive Schreiner, author of "The Story of an African Farm" and other entertaining stories, has married a man whose ideas are as advanced as her own. Instead of conferring his name upon his wife, he has taken hers, and become Mr. Cronwright Schreiner. It seems as if this is carrying the matter a little too far, and yet, as the world has never heard of Mr. Cronwright and has heard a great deal of Olive Schreiner, perhaps it is all right. Really, when we come to think of it, it is nobody's business but their own.

Congressman Breckenridge, of Kentucky, expressed himself in 1891 as very much opposed to woman suffrage. He feared "it would affect the present relations of husband and wife." We have, since then, had the Colonel's own testimony as to his idea

of the relations which a husband should sustain to a wife, with practical illustrations by the Colonel himself. With the incoming of woman suffrage, such men as Mr. Breckenridge read the handwriting on the wall.

#### *Where Reformation Should Commence.*

"Not long ago one young man was overheard to remark to another that the girls did not care if they (the boys) did drink, they would go with them just the same. There is too much truth in this. Young ladies do too often go with young men who drink. If the fellow is well dressed and pretty good looking they do not question his principles. Our young ladies are not half awake to the real evils of strong drink, or the sorrows that come to those who are the wives of drunkards. Neither are they awake to their own responsibility. Christian young ladies, and even those who are working in temperance organizations where they hear so much about the curse of intemperance, will often marry men who drink occasionally. They flatter themselves that when once married these young men will give up drinking and the companionship of "the boys" and all will be well. She 'marries a man to save him,' but in a few months awakes to the fact that instead of helping him to a better life, he has dragged her down to a lower one. It is time the young ladies give heed to the experiences of the past, and require as many virtues in young men as the young men require in them. We do not see young men of sterling worth marrying girls that drink, smoke or gamble. There is no good reason why young men should not be just as moral as young women, and it is largely the fault of the women that there are different codes in practice in the social world.

"Young women not only owe it to themselves and their own future happiness that what is right for one should be right for the other, but they owe it to the young men also. Many a man has been eternally lost because some woman made light of his faults. If, instead of treating them lightly, she had talked with him faithfully, and then firmly refused his company until he reformed, she could have helped him to a better life. But remember, this must be done *before* instead of *after* marriage."

The above lines were copied from *The Zion Watchman*, and every word is only too true. I send them to you for publication hoping every young lady that reads the MAGAZINE will read and think over them and try to exert a good influence over young men.

McDONALD, TENN.

[We endorse in the strongest manner every word of the above article.—Ed.]

*Eugenia Hawk.*

**THE SONGS THAT RILEY SINGS.**

What music could be sweeter than the rhythm of the rain.

Or the oft repeated measure of the katydid's refrain?  
Or the droning of the pollen-laden bumble-bee that wings

Through the sunny summer hazes of the songs that Riley sings?

Oh, I linger as I loiter through a little rhymeland and street.

Till I know the very pattern of the shadows at my feet.

And my happy heart beats faster with the stimulant of joy.

As I hear the bubbling laughter of a ragged little boy.

Oh, little boy of Riley's with your trousers worn and old.

With your freckled face, and tattered hat, and sunny heart of gold.

I never knew how blue the sky nor clover fields how sweet.

Till I followed in the pathway of your dusty little feet.

Oh, Haly, little Haly! I am mourning with the rest:  
For I love each blade of timothy your little feet have pressed.

Oh, the sadness and the gladness and the breath of many springs.

In the rhyming, chiming melodies the Hoosier poet sings.

—Lee Lloyd, in *Kate Field's Washington*.

**About Cosmetics.**

Without doubt the only permanent aid to beauty is a sound mind in a sound body. As early as the days of Aspasia in Greece and Cleopatra in Egypt artificial means for enhancing the beauty and improving the complexion were in use. The word "cosmetic" does not mean paints and washes for the face, as is generally understood nowadays, says the *New York Commercial Advertiser*. It means adorning, and applies to every part of the toilet, and even to the dress. It is the art of embellishing everything we see, whether face, neck, shoulders, arms, hands, hair, feet or breast.

In medicine it goes even further, but its mission to the world of beauty suffices us for the present. The ancient Jews, Greeks and Romans were the masters of the arts of cosmetics. The bible gives recipes for their use, and we read of Hebrew women passing the greater part of the day in adorning themselves. In Rome the art of increasing the beauty at one time became a popular frenzy. It is told of a patrician Roman lady that she had no less than eighteen women to help her at her toilet; and to each was intrusted only one part of the person.

When a Roman lady arose in the morning, her first act was to plunge into a bath of perfumed oil, and afterward a bath of tepid water, which had been sprinkled with oil of roses. Perfumed soaps that were worth their weight in gold were used in these baths. Gray hairs were always died black, but some women preferred a golden yellow, or even a blue. Roman women preferred to look pale, and consequently powdered their cheeks with prepared chalk. They were acquainted with rouge, which was used

to stain the lips and the nails, but never on the face. They stained their eyebrows and eyelashes by means of smoked pins, and a delicate pink tint was given to the insides of the nostrils with carmine. Manicures and petticores were well known to the Romans, and rich ladies would keep several in their employ.

During the reformation cosmetics went out of favor, but they were soon revived in France. At the present time balms and other forms of cosmetics are so extensively advertised that we must believe they are very generally used. In the day time it is easy to detect the dyed hair or the stained face, and the electric light is a keen detective of such superficial beauty.

After all, sound health and a contented mind are the two greatest beautifiers in the world with the decided advantage in their favor that the beauty they give improves in the sunlight and does not vanish when the gas is turned on.

**Music in His Heels.**

Col. Julian K. Larke, is a journalist and a veteran of the Crimean war. Col. Larke is a gray-haired man full of reminiscences and very fond of music. He often plays the organ for secret societies. Recently a big society gave a swell reception and the colonel furnished the organ music. After the wine had been flowing steadily for an hour and the banquet had disappeared, a veteran amused them all by walking on his hands. The colonel was seated at the organ trying to find the lost chord, but he stopped the search long enough to gaze at the hand-walking feat.

"You can't beat that, colonel," some one said in jest.

"Oh, can't I? You don't know me. I am an athlete," he replied modestly.

Much bandage followed, and finally the colonel said if someone would work the organ pedals for him he would show them a trick he used to do in England.

The pedals were worked and the colonel leaped into the center of the room as agile as a squirrel. Rising nimbly on his hands, his feet in the air, he walked quickly to the organ and to the astonishment of every one played "Home, Sweet Home," with his heels. As an encore he played "Will Never Get Drunk any More." Still standing on his hands he walked to the center of the room and turned a half-dozen handsprings. Considering his advanced age and the fact that his body is filled with leaden bullets it was a most wonderful feat.—*Ex.*

"You have plenty of reading here," said a visitor to the literary editor, pointing to a pile of books on the editorial desk.

"These are not for reading," replied the editor. "They are for reviewing."

AUGUST, 1894.

### THE SITUATION.

On Friday, May 19th, the employes of the Pullman Palace Car Company, at Pullman, struck against a reduction of wages, tyranny and degradation, and the strike has steadily progressed until it has attained continental proportions.

It is not the purpose of this article to recite incidents of the strike, but rather to point out the reasons why of the strike that has led to present conditions, with such reflections as the subject suggests.

Let it be said at the start that the Pullman employes never, at any time, objected to the rapid increase of Mr. Geo. M. Pullman's great wealth, though his multi-millions represented very accurately the amount he had, by financial legerdemain, abstracted from them. What they wanted, and the utmost they demanded, was fair wages and honorable treatment.

The employes of the Pullman Palace Car Company, like the great mass of their fellow toilers, preferred to submit to extortion and injustice as long as the wrongs could be borne rather than interfere with the plans of the company or create any disturbance. The testimony that such is the distinguishing trait of the great body of American workingmen is overwhelming.

There is not a strike on record which, upon investigation, does not disclose the fact that labor had been cruelly wronged, and the wonder has been that American workingmen could be induced to bear the outrages inflicted upon them so long and so patiently.

In writing of the situation it were su-

preme folly to so much as intimate that workingmen have been unmindful of the losses and sacrifices incident to the adoption of extreme measures to maintain their rights. They have comprehended more fully than others the bitterness of the ordeal they would be required to pass in vindicating their manhood and their just demands, and the strikes which have occurred, whether success or defeat attended them, have, in every instance, added indefinitely to the glory of the sturdy manhood of American workingmen.

No one questions the declaration that a strike is quasi war, not necessarily sanguinary, though now and then, blood and carnage have told the terrible penalties labor has paid in its efforts to obtain the privilege of living as becomes American citizens.

For the strike now on, as we write of the situation, Geo. M. Pullman is responsible. It is becoming awfully tragic, and history will declare, when peace is restored, that it had its origin in the venality, despotism and oppression of Geo. M. Pullman. He is the author of the present situation. He began years ago to lay the foundation of his autocracy at the town of Pullman. This fact is vividly shown in an editorial article in the *Chicago Herald*. That paper says:

In advance of the inevitable trial, Mr. Pullman will do well to consider certain facts. He has set up in the town of Pullman a modern satrapy—a survival of medieval feudalism repugnant to the thought and spirit of the nineteenth century. He has endeavored to combine a great industrial establishment with a hodge-podge jumble of Bellamy socialism and Russian autocracy. He has attempted to revive in America an institution that has not been seen since the fifteenth or sixteenth century.

How well the experiment has succeeded he himself can testify. Satisfactory at first, like all things novel, the "model town" has degenerated. The "thousands of happy, contented, well-paid workmen" have been transformed by degrees into sullen, discontented strikers—justified, unhappily, in their sullenness and discontent. The wheels are idle, the chimneys of the mills stand smokeless.

Does Mr. Pullman feel justified in continuing the strike? Granting that he may defeat his striking employes this time, does he care to invite another and another—and yet another—inevitable so long as wrong conditions exist? These are the conditions he should consider carefully, and any true friend—if he has one—will advise him as to their answer.

He should subdivide his town and sell lots to anyone who will buy. He should abolish the system of overseers and inspectors and quasi spies. He should

enfranchise his men and make them free men instead of feudal retainers. He should come down from his dual throne and take his place among Americans as an American. He should become a democrat instead of an autocrat: a benefactor rather than a slave driver. He should be a man.

In the foregoing the reader has a graphic pen picture of Geo. M. Pullman. In his "Russian autocracy," his sub-autocrats and "quasi-spies" we have the origin of the strike and the cause of the present situation, aided by the railroad managers combined to perpetuate the strike regardless of the cost of money and blood.

The policy of Geo. M. Pullman to rob his employes is characteristic of the man. His insatiable thirst for money is not confined to his piracies upon his employes, but extends to the public, and his methods of robbery are so much like those of an outlaw as to make them a subject of congressional investigation. As a consequence, Senator John Sherman, of Ohio, introduced a resolution to investigate Geo. M. Pullman's piracies, and the resolution was adopted by the United States Senate, the purpose of the resolution being to put an end to Pullman's plunderings of the public.

In an interview, published in the *St. Louis Globe-Democrat*, Senator Sherman took special pains to point out the infamies practiced by Geo. M. Pullman, and among other things said:

I regard the Pullman Company and Sugar Trust as the most outrageous monopolies of the day. They make enormous profits and give their patrons little or nothing in return in proportion.

Senator Sherman gives Geo. M. Pullman a certificate of character so infamous that the government proposes to clip his claws and restrain his rapacity. He is, probably, the first plutocrat made rich by plundering employes and the traveling public to be subjected to investigation and punishment for his crimes, and yet this rogue receives the aid of railroad managers, who form an alliance with him that they may perpetuate his piracies and reap a per cent. of the plunder.

This fact brings into view the question of sympathy on the part of labor organizations for the oppressed and robbed Pullman employes.

This sympathetic feeling has had much to do in creating present conditions. This

purpose of workingmen to aid their fellow toilers when in trouble, a trait of human nature worthy of the highest eulogy, is almost universally denounced by the press of the country, while the action of railroad managers is commended. Such exhibitions of high consideration of Pullman and his pals and brutal denunciation of workingmen who have by words and deeds shown sympathy for the Pullman employes, is a feature of the situation which has tended to aggravate conditions. The men who sympathize with their fellow-men in distress are those who are animated by the spirit of Christ, and those who denounce them and malign them for such exhibitions of brotherly feeling, without which the world would be transformed as if by Jehovah's decree into a hell, are the Pharisees, the canting hypocrites, who "devour widow's houses," and for a "pretence, make long prayers," and who, therefore, as Christ said, are entitled to "special damnation." These "whited sepulchers," these plutocrats and their sycophantic parasites—fleas in the hair of the Pullman dog—do not complain of sympathy when one corporation or a dozen corporations combine with the Pullman corporation and express their profound sympathy for Pullman, though they see the 4,000 victims of his rapacity reduced to suffering.

We do not write of the situation to approve or to extenuate violence. We deplore such incidents of strikes. The LOCOMOTIVE FIREMEN'S MAGAZINE has never, since it passed under our control, applauded a wrong. It has been our purpose to enthrone and uphold the right. But there has never been a strike of any notable proportions that deeds of violence, more or less deplorable, have not occurred. Why? Is it because men are depraved? Is it because men are brutified? By no means. Admitting that a strike is war pre-supposes resisting forces—power confronted by power. Strikes are always based upon a principle, exceptions confirm the rule. Labor demands fair wages, it strikes against oppression, poverty, squalor, degradation, and all the numberless woes that oppression, injustice and tyranny inflicts. The enemies of labor, those who oppose the working-

men, are those who rob them and the conscienceless gang of boot-lickers, who hope to profit in some way by their fealty to power. In good old colony times, when the king imposed the tea tax, brave men, disguised, boarded a ship loaded with tea and threw the entire cargo overboard. The king and his Tories protested, and out of such acts of heroic defiance came the revolutionary war, and from out of the war came the American republic. Where labor has triumphed in a strike society has always been benefited, and where the strike was lost society has always been the loser. Why? Because society is profoundly interested in the preservation of the manhood, independence and prosperity of the masses, while plutocrats, governed only by their greed, look only to their own interests, which they hold are promoted by the degradation of labor, because with that degradation wages go down and their piracies become the more profitable.

Under such circumstances it is not only not strange but natural that in the contention for supremacy by the forces of the right and the forces of the wrong deeds of violence should sometimes occur. It is human nature—it is history, and history will repeat itself until the day of darkness comes for our land, when plutocrats are supreme, or think themselves supreme. Before an amazed country, the preliminary acts of a mighty tragedy are being acted, and it were well to let the curtain fall.

The condition of the country is becoming hourly more momentous. The camps are all astir, where drums beat the long roll and the bugles call to arms. The President of the United States, the commander-in-chief of the army and the navy, is concentrating his battalions in various places. When a semi-savage queen had been dethroned in the interest of good government and of civilization, the president became so profoundly stirred that he sent a private commissioner to feel the pulse of the old queen and report to him how matters stood; but when 4,000 Pullman employees were being ground to dust between corporation mill stones the commander-in-chief goes a fishing, and at the call of courts concentrates soldiers of his standing army, a la

czar, at various points with orders to fertilize American soil with the blood of American workingmen. As we write the work of blood-letting has begun and the street gutters of Chicago are running red with blood.

The situation is one of terrible significance. The country is alarmed. More than one-half of the continent is involved and the army of the idle is increasing. Geo. M. Pullman's greed, depravity and despotism aided by the alliance of railroad managers have brought about conditions of peril from the contemplation of which bold men turn away.

As we conclude this article, it must be said that the situation is full of premonitions that the worst has not been reached. There are no encouraging symptoms. The outlook is in all directions disheartening. Around the horizon and overhead naught but storm clouds meets the vision. The vivid flash of the lightnings of anger accompanied by the sullen, deep-toned mutterings of human voices mingled with the explosions of powder, bode only evil. But, regardless of the outcome, it will be written that Geo. M. Pullman and his confederate despoilers of labor were responsible.

#### LEGISLATION.

It will be conceded, we assume that legislation is the means by which governments exist and are perpetuated: legislation, signifying law making, a legislator is a lawmaker, one clothed with legal authority to make laws—hence, absolute rulers are legislators, their decrees are laws. Absolutism in government has not been popular hitherto in the United States. We boast of a government by the people, we talk of the sovereignty of the citizen, and yet, whether a law is made by an autocrat, a congress or a legislature matters little, it has precisely the same end in view and reaches it; by the autocrat, with terrible directness, by a limited monarchy and a democracy, by a more circuitous route, but in at least three objective points, results are the same. All the autocrat can do, or the extreme of his power, is to take: (1) life, (2) liberty and (3) property, and the mildest government on the face of the earth, regardless of name, can do and does the

same things. We are not discussing processes, but results. In the instances cited, autocracy and democracy do precisely the same things. The case admits of neither sophism, technicality, nor special pleading: the facts are as stated, and in both cases the claim set up, is the supremacy of law. In the United States, the people discuss legislation. Here we have a free press and free speech; here, the people, excepting always office-holders, parasites, lickspittles and all the fawning crew of boot-lickers, are not afraid of officials, from a coroner who sits on a corpse to a president; the people have a fad that these officials are simply servants, not masters, and yet these servants (?) in congress and legislatures enact laws as infamous as ever disgraced an autocracy. The machinery constructed by the government by the people, crushes and grinds and kills and robs, just the same as a government by a czar, sultan or shah, as we have remarked, with a little more circumlocution, but ultimately reaching the same result.

Let it be understood, that we are not defending autocracy, nor aristocracy, nor any other ocracy, except democracy, the supreme will of the people, but it is, nevertheless, true, that when legislation crushes an individual, it does not matter to him or her, whether he or she is the victim of the decree of an autocrat or of a law enacted by a body chosen by the people. If the life of a man is taken, what matters it to the victim who ordered his death? After the halter, the ax, or the bullet has done their work, subsequent proceedings no longer interest the victim, but between sentence and execution the condemned may if he regards his sentence unjust engage in very serious reflections however unprofitable they may be. If the subject of an autocrat, having no voice in the government, he will not accuse himself of having had any agency whatever in bringing about his doom, and the same would be true if the despot had deprived him of his liberty or his property, having had no voice in shaping the laws under which he suffers, he could not reproach himself for any dereliction of duty, he simply had to submit in silence to death, slavery and poverty as his master

might choose. But in a government like ours, if by the operation of law calamities overtook and overwhelmed him, he could not submit without realizing that in some measure he had been the author of the misfortunes of which he complained. He had lived in a land where the people were the sovereigns, in a land where ballots determined everything, and if he voted for vicious men and continued to vote for them, he would be regarded in a measure, and a very large measure, the author of the calamities he bewailed and would be entitled to precious little sympathy.

To this it has come. Legislation is largely accountable for the national ills which are now of such a formidable character as to excite universal alarm, and the people who have been choosing vicious representatives are primarily responsible for every vicious law upon the statute books; blinded by partisan fealty, the people have for years pursued a course which has at last produced a crop of bitter fruits, and the end is not yet to be seen. Men see the frowning cloud and the vivid flash of the lightning, and they hear the deep toned mutterings of the thunder, and when any suggestion is made by workmen that a different class of representatives are required to enact wise and just laws, and to repeal vicious and odious statutes, a subsidized press, and bribe cursed and debauched men cry out "politics, politics," as if there was some other way out of the darkness into the light, some other way from peril to safety other than politics, something superior to the ballot wielded by honest, conscientious men. But there is no other method of relief that comports with our system of government. If our liberties are to be maintained, if our institutions are to be perpetuated, it must be done by a free, untrammelled ballot, and men must be in politics if they vote at all, and when men can be persuaded to vote for honest men pledged to honest measures, plutocrats will cease to rob, will cease to have at their beck and call the armies of the states and of the nation to aid them in their piracies upon labor, and they will have a judiciary which, under ermined robes will cease to hide an untold amount of infamy.

## A MILITARY ERA.

Away back, some six or seven hundred years before the dawn of the Christian era, Isaiah, the prophet, with a prophet's vision saw, or thought he saw, a time when the nations would "beat their swords into plowshares, and their spears into pruning hooks," when "nation would not lift up sword against nation," and when they would "learn war no more," and some six hundred years after Isaiah's prophetic words Christ was born, and the angels filled the world with rapture when they sang, "Glory to God in the highest, and on earth peace, good will toward men." It would scarcely be becoming to so much as intimate that Isaiah was the victim of hallucination, but so far, though twenty-four centuries have come and gone since he saw the disappearance of swords and spears, the nations are still learning war, and if here and there swords have been transformed into plowshares and spears into pruning hooks, it has been because more effective death-dealing weapons have been available, and instead of "on earth peace," as the angels proclaimed, the war spirit has dominated the world, and never more completely than at present. Indeed, the present may very properly be regarded as a military era.

We have no desire to write of the military establishments of European nations—all Christians except a handful of Turks, and all trusting to guns instead of gospel, to powder rather than to prayer to carry forward our Christian civilization. We are particularly interested in the military affairs of the United States. True, as a nation, in our infancy we were rocked in a war cradle, and the music of the nursery was supplied by fife and drum, the scream of bullets and the bursting of bombs. There were blood and carnage all the way from Boston to Charleston. There was a Continental army with Washington at its head, and yet when the war was over and England retired from the fray, the Continental army disappeared as if by enchantment. There was no war spirit in time of peace, because peace hath her victories as renowned as war, indeed, far more renowned. Again, in 1812-15, when troops were required, the people, who are the gov-

ernment, supplied them, and when peace was declared everything bearing the appearance of war vanished. Again, in 1860-65, the people responded, saved the union, and this done, soldiers became citizens. Standing armies are a menace to liberty, hence, as a nation, we do not want one, and will not tolerate such a machine to aid the schemes of heartless, ambitious men. But at this particular juncture ceaseless efforts are made to infuse the American people with what is called a "war spirit." True, there is no war, nor a probability of war, but there are thousands, soft-shelled lads, dudes and donkeys, who are persuaded by men of small caliber who are ambitious to wear swords and parade for the delectation of hoodlums, to enlist in what they call the "home guard," the "state legion." This would be innocent enough were it not for the fact that these military nincompoops are the creatures of designing men, corporation plutocrats and mine owners who, by the aid of high state officials, can use the troops to perpetuate such outrages as their greed may require.

The press, as is usual, comes to the rescue and advocates more troops, better equipments, better guns with longer range, that death may be more certain. They say the times demand greater military power, but a military power is autocratic, it is despotic, cruel, heartless, murderous, bloody, and the only power which can reduce freemen to slaves. Why is there such a clamor for the establishment of such a power in the United States of America? Where are the enemies of our "God favored country"? Who are these enemies? What is their character? What are their implements of warfare? These are pertinent questions. They go to the marrow of conditions. They sink down into the soul of the nation like lead in still waters. What answers are made to these interrogatories? They come from every direction, north and south, east and west, from center to circumference. The enemies to be killed by the military power are the workingmen of the country. They are found in our mines. They dig coal, iron, lead, zinc, quicksilver, copper, silver and gold. The enemies of the country are found at the blazing, roaring forge.

They are in all the factories where wheels move by steam power or water power; they are along all of the 500,000 miles of land and water transportation; peaceful, patient, industrious, they constitute the power that moves the world. Their implements of warfare are the pick, the hammer, the engine, the ten thousand and one tools with which workingmen build all the monuments that mark the country's progress and glorify our civilization. To subjugate such enemies is the high ambition of the plutocrats who clamor for troops. Steadily by degrees these enemies are being subjugated by the standing armies of states and of the nation. The dance of death and degradation goes merrily on. The sublime purpose of the war spirit now sought to be aroused is the reduction of the wages of workingmen and working women. To reduce wages builds up fortunes on the one hand, and on the other hand scoops out a deeper degradation for the wretched victims of the military power. The work is going bravely on. Every year the law forges fresh manacles for labor, and now the suggestion is that additional power shall be given the military arm; that it shall be larger and have a more devilish grasp; that it shall be stronger that it may strike a more death-dealing blow. To increase the military power, to whom do the plutocrats and their fawning, lickspittle press propose to appeal? To workingmen—and "tell it not in Gath, publish it not in the streets of Askelons," these plutocrats and their aiders and abettors expect to recruit their armies from the ranks of workingmen. Since time begun such an insult was never offered free men. And now the question arises, how do workingmen treat the unspeakable insolence and indignity? To hear the reply is enough to make all the pagan gods retire from the business, enough to make a brass dog tuck its tail between its legs and howl, for it is a fact that workingmen, black, white and yellow fall into line in this military force and go forth to shoot workingmen whose crime is that they resist degradation.

The theory that ours is a "government of the people, by the people and for the people," was once well founded. A change has come. We cling to the shadow but the

substance is disappearing. We have the shell but a military serpent has aboutsucked its last remaining liberty-sustaining principle. The government is rapidly becoming a military despotism. Laws are made to enrich the few and enslave the many, and the military arm, already powerful, is to be made more potent to trample upon justice, crown and enthrone the wrong, bludgeon truth to silence and exile right.

The crisis is here. It is possible for workingmen to aid their enemies by joining the military, or they may by their ballots make for themselves a destiny of freedom.

#### PROBABILITIES AND POSSIBILITIES.

There was never a period in the history of labor, when probabilities and possibilities were so entangled in men's minds as at present. The most astute are unable to map out a pathway to any goal, near or afar, and the problems which confront the most thoughtful are becoming every day more complex and stubborn.

Men write and reason only to increase confusion. Facts are so repellent, that probabilities degenerate to possibilities and suddenly become improbabilities, if not impossibilities, when it is found necessary to change front, choose some new road and pursue it until again confronted with obstacles which will not yield, and then things proceed while affairs grow worse by degrees, and rapidly assume conditions which are admittedly full of peril.

What are the probabilities for the future of labor? Are they of a character warranting the conclusion that its condition will improve, or that it will be less prosperous than at present—in a word, become worse? Scanning the situation as a mariner surveys the skies, what probabilities are discovered? Are not all probabilities merged into possibilities? Do men say this or that is probable, or that it is possible? Take, for instance, the question of wages. What is probable? Is it likely that present rates of wages will be maintained? Is it presumed that wages will decline? Is it to be expected that wages will advance? In discussing such propositions, if probabilities are about equal, then they are contradictory and dis-

appear to give place to possibilities or to chance and everything is at sea—deep sea, where there are no soundings, or navigators of the labor ships are sailing amidst treacherous currents and perilous surroundings.

Discussing probabilities, we mention arbitration, sometimes thought to be a panacea for labor troubles, a desideratum, the one thing needful to take wrong from the throne and place it upon the scaffold. Arbitration is as old as the eternal hills. It is primal, has been in vogue since prehistoric men disagreed about flints and furs. Arbitration fills the bill sometimes. To arbitrate presupposes that one of the parties demands more than simple justice requires, and that concessions must be made by one party or both. There are advocates of arbitration, who are so much in love with the theory that they would eliminate the voluntary feature and introduce compulsory, arbitrary arbitration, according to statute, which is not arbitration in fact, or as the term is generally understood, but rather a court to hear and decide arbitrarily, with penalties attached to enforce decisions. It goes for little, or for nothing at all, to contend that such arbitration settles the disputed points. To say that a settlement thus arrived at is better for labor, is to intimate that labor needs a guardian created by law to take charge of its interests and determine what is best for it. And here the question arises, is it probable that working men will submit to such an arrangement and surrender their right to determine for themselves what methods shall be adopted to protect their interests? We think the probabilities are not in the direction of compulsory arbitration, though there is a possibility of such a thing. It would doubtless happen that a corporation would cut down wages to an extent that organized labor would revolt. In such a case the compulsory arbitration law would doubtless compel the aggrieved organized workingmen to submit to the reduction of wages or appeal to the arbitration law for redress. Suppose the rate of wages was \$1.25 per day, and the corporation cut it down to \$1.00? Organized labor would seek to show that \$1.00 a day was insufficient wages, but if the corporation would come in

and show it could have all the men it wanted at that price, what would the arbitrators be likely to decide? Would they say the corporation should pay \$1.25 a day, when the proof was that they could hire men to do their work for \$1.00 a day? True, organized labor might show that the men offering to work for convict prices were scabs, but the corporation would insist they were men, capable to perform the labor required, in which case the arbitrators would be in a dilemma, and their decision, if it had any effect at all, would be the creation of a wage scale. Is it probable, or even possible that workingmen will, by their votes, encourage such a scheme? That non-union men may favor such an arrangement, it is both possible and probable, but it ought not to be either probable nor possible for union workmen to place in the hands of any set of men the determination of wages, upon which their lives, their liberties and their happiness depend. The probable ought to be that workingmen will not build scaffolds for their own immolation. Why should it be possible for a body of organized workingmen to place in the hands of one man the power to annul the will of a majority of their number when authoratively expressed? Such a thing beggars all ideas of the probable and enthrones the wrong in human affairs, and places the right on the scaffold, which makes the most hopeful doubt, begets distrust where there should be confidence and the most courageous halt in their advance. This thing of conferring autocratic power and surrendering in advance, ought to stand in the catalogue of possibilities. It ought to be classed with the impossibilities.

Federation of labor organizations has been for years the battle cry, and a federation that would proclaim labor invincible when contending against its foes is a possibility, just as it is possible for a time to come when the lion and the ox will eat straw together from the same stack, when the ox will forget that it has horns and the lion will cease using its paws, but to class such things as probabilities, or even possibilities smacks of hallucination. Why? Because in the present condition of what is called "human nature," the class rises su-

perior to the cause, and each for all and all for each, does not exercise sufficient sway to create a probability, nor even a possibility that any sort of a federation is at hand which will make an iron worker, for instance, the champion of the rights of a cigar maker, and thus on through the entire list of trades. These are glowing theories *ad infinitum* and *ad nauseum*, but when an emergency arises, men survey a desert where not even a cactus, nor a sprig of sage grass of the practical appears. Worse, still, perhaps, federation is used just as the devil quotes scripture, to beguile its votaries and make conditions worse. Federation is possible. We have it now, and have had it for years past and gone, and men who are at all thoughtful, in surveying the field and contemplating results are reminded of the "barren fig tree" with an abundance of foliage and no fruit. Is it probable that this sort of federation is to go on forever? Certainly, it is possible. Men now, as in the past, are wedded to idols, and the difference between worshipping a stock or a stone, and a form of federation that is inefficient, is scarcely apparent.

Is it probable that something better will come? Is it possible for workmen to suggest an improvement upon federation? We do not doubt it. We suggest consolidation of trades and callings. We mean one government, one constitution, one supreme law, one flag, one shibboleth—"labor omnia vincet." With this consolidation labor organizations become invincible. Are there any precedents calculated to encourage and inspire confidence? Assuredly. On every page of authentic history there are examples of the conquering power of the consolidation of forces, and a government becomes contemptible in the eyes of all nations, where it is either incapable or neglects to protect its humblest citizen against outrages perpetrated by any other sovereignty. Is it probable that labor will consolidate its forces, and thus make it possible to protect, even one of its members against outrage?

The verdict of the world, long since rendered, is that a nation never expands to greater or sublimer proportions than when with its consolidated power it redresses the wrongs inflicted upon one of its citizens, and

an example or two furnished by the United States of America illustrates our idea. Some years ago a subject of the emperor of Austria came to the United States and simply declared his intention to become an American citizen. Soon after he visited his native land, and was arrested, his American citizenship was ignored, and he was required to do military duty for a government he had renounced. An American battleship was in an Austrian port, and its commander having learned that Martin Costa, the American citizen referred to, was in that city, demanded his release and that he should promptly be sent on board of his ship and be placed under the protection of the American flag. The authorities hesitating to obey the order, the battleship was brought broadside to the city and her decks cleared for action. Her guns were shotted, and then came the order, "Send Martin Costa, the American citizen, on board my ship or I'll bombard your city." It was enough. The American citizen was rescued. The name of an obscure man was given to history. The right was vindicated. American citizenship was made to mean something, and American power and prestige was something more than sounding brass.

Again, an utterly unknown American citizen was wrongfully imprisoned by the authorities of Mexico. His liberation was demanded by the American government. Mexico hesitated. Then came an exhibition of power on the Mexican border, and the peremptory order to release the American citizen. It sufficed, and the prison doors swung open, and the prisoner was free. The incidents related were premonitions of war in the event the humble and obscure American citizens had not been surrendered. These were exhibitions of consolidated power to resist wrong and oppression, and the world applauded. In labor affairs, consolidated power on the part of organizations would achieve the same results, by different methods. There would be no military display, no bugle calls to sanguinary strife, but the power exerted would not be less potential in securing beneficent results. When a corporation oppressed a wiper, a trackman, or a shopman, his case would at once concen-

trate upon it the consolidated power of the organizations. If it were a railroad the demand would be made to remove the burden from the humble worker, and a refusal would hush to Pompeian silence the industry. True, there would be inconvenience, but justice would demand the sacrifice, the wrong would be taken from the throne and placed upon the scaffold, and he would be a degenerate American who would not rejoice over such a victory.

It is possible to consolidate. It is possible to enthrone the right. It is possible to be true and brave and honest. What are the probabilities? We think they are cheering. We believe the outlook is hopeful. We fancy we see the dawning of a better day for labor in every field of toil. Men are learning to analyze errors and to eliminate them, and possibilities are becoming probabilities. Entrenched errors are hard to dislodge, but with consolidation of the forces of labor such notable victories would be won for the right, that men would wonder as they contemplate the dreary road labor has traveled to reach, at last, the goal of success.

#### CARNOT.

The president of the French republic was believed to be a great and a good man. Under any circumstances, the civilized world would have lamented his death. But President Carnot did not *die*. He was *killed*—murdered—by an Italian mad dog, a human wild beast, an anarchist. This makes the taking off of the distinguished Frenchman a horror. When a heartless despot who murders, tortures and exiles the victims of his power, is killed, free men show signs of neither grief nor sympathy. Such autocrats are simply monsters, and the great mass of mankind breathe freer when they are dead. President Carnot was not a despot. He ruled France to the extent of the power conferred upon him by the people, and some consolation is derived from the fact that his murderer was not a Frenchman, indication of the fact that, as president, Carnot was acceptable to France.

An effort is made to show that the assassination of the French president has no political significance, because all the crowned heads of Europe make haste to send slob-

bering messages of regret and condolence, as if they had been deprived of a personal friend—a royal game of Machiavelianism, duplicity and cunning, which Frenchmen, at least, understand. France stands forth as a ceaseless menace to royalty, and all the shams and infamies perpetrated under the dogma of a divine right to rule, and it matters nothing what King Humbert or Emperor William may say; they and all the rest of the crowned heads would be delighted to see France again in the grasp of a revolution the result of which might be, France once more a monarchy.

It is doubtless quite true that in the work of exterminating anarchists all European nations are in alliance, because anarchists profess that it is their mission to kill them when opportunities offer, but, beyond this, there is in Europe no friendship for France. As for anarchists, they are the same, regardless of nationality, opposed to all law; they are insane enough to believe that by assassinating chief rulers and by throwing bombs they can destroy law and government and upon the ruins inaugurate chaos. They are making little headway, though they do create unrest and consternation. Anarchists have no respect for law. They are the defiant enemies of law and order, and it is here that a grave question arises. Are governments doing that which has a tendency to create a disrespect for law? What are the facts in the United States? The press of the country is ceaselessly pointing out vicious laws, denouncing their authors, and holding them up to universal scorn and contempt. It does not help matters in the least to say—as is said, "Such things are done and said for partisan purposes." Indeed, the fact only makes the situation worse—unspeakably worse. Not a legislature in our forty states can assemble without being accused of bribery and debauchery. Scarcely a law is passed that is believed to be free from the taint of corruption. What is the result? It is to create a universal distrust, a deep, all pervading belief that law-makers are debased, unfaithful, and that the laws they make are vicious. In this we have the basis of anarchism. We state the case mildly. Proof is at hand, and it is overwhelming. The U. S. senate, once held to

be the most august law-making body in the world, is to day the synonym of all that is infamous. Two great trusts, that of sugar and that of whiskey, it is charged, dominate legislation, and certain senators are named as traitors to principle. What is the result? The nation is to have a tariff law covered all over with infamy, blotched with bribery, and universally condemned. Anarchists despise law—all law, good and bad, and, blinded by hate of bad laws, they are unable to discover the good in any statute, and condemn the entire code. It could scarcely be expected that anything better could result when the press of the country, secular and religious, independent and partisan, is ceaselessly condemning law and the administration of law.

Recently, in the state of Indiana, a national bank was wrecked, and hundreds of depositors were reduced to poverty. The president, a representative Christian in a great church with two steeples, confessed his guilt. He had robbed his depositors of at least \$800,000. He lived in clover a foot high. His home was palatial. He had stolen it from confiding men and women. The law fixed his penalty at from two to ten years in the penitentiary, and the judge who sentenced him to six years almost choked with sympathy when sentencing the old scoundrel. When he arrived at the prison there was another exhibition of profound sympathy, in which the warden made a consummate ass of himself. And, mind you, the palatial home of the hoary old thief had been transferred to Mrs. Bankwrecker, while widows and orphans, in their rage, in silence and sorrow, witness the game of law in which a rich and religious thief wins the pot. Men look on, and noticing how differently a poor devil who has stolen a coat or a side of bacon is treated, silently and sometimes vociferously curse such exhibitions of administration of the law. And prudent men say, "Such things are well calculated to make anarchists."

In connection with this case of bank-wrecking were two prominent business scoundrels who aided the president of the bank to wreck it and get away with \$325,000. They were, like the president of the bank, pillars in a fashionable church.

They were found guilty. The trial developed that they were a brace of polished, cultured, intellectual, religious scoundrels. They gave liberally of their swag to aid in building up Christ's kingdom on the earth, they owned aristocratic pews in the sanctuary, they contributed liberally to pay the priest's fat salary. Two more rascally religious disciples never paid tithes, or made long prayers, but they were found guilty. One was sentenced to ten, and the other to six years imprisonment. Over these two miscreants the divine who practiced theology for their benefit broke down and went all to pieces. He followed the convicts into court, into jail and into the penitentiary, and sobbed like a water plug all along the line. But the religious rascals had to go to the penitentiary, had to have their heads shaved, had to be measured, numbered, weighed and photographed, wear stripes, dine at the *table d'hôte* and sleep in a cell; but here again the prison officials exhibited their asinine qualities of head and heart, and expressed regret that they could not be treated in a way more becoming their social status. Men looked on in wonder and disgust. They saw that, even in a penitentiary crime did not level down; that an educated, cultured, religious scamp, creature saturated with villainy, had a better show than a poor devil, who, instead of stealing \$325,000, had stolen only \$3.25. Such things bring law, and the administration of law, into contempt, and are well calculated to produce anarchists. But this is not all of the shameful business. The two religious rascals, having lots of money saved out of the \$325,000 stolen from the bank, could employ high priced attorneys and at once a scheme was set on foot to get the rascals out of prison. They had been fairly tried before an honest judge and by an honest jury, had received their sentence and were incarcerated. But that amounted to nothing. There was a higher court, and after a few days of consultation the scamps came out of prison, gave bonds and are as free as other rascals who have served full time. Here again the common people denounce such laws and such court proceedings—their indignation is righteous. They say

"such things make anarchists," and they tell the truth. If it is desirable to arrest the growth of anarchism it would be well to put a stop to practices sanctioned by law which create anarchists.

#### A MONEY POWER.

If we are to believe the half we hear and read about the money power, of its ceaseless grindings, like the mills of the gods, we would scarcely believe that the American people by their votes have created and still maintain one of the most colossal money powers known to the civilized nations of the earth. Such is the fact, nevertheless, and the national banks of the United States constitute that money power which workingmen endorse by their votes.

We have before us, as we write, the report of James H. Eckels, comptroller of the currency, brought down to December 4th, 1893, and the figures we give may be regarded as authentic, and it must be said they ought to set men to thinking who in a general, haphazard way discuss the "money power."

On the 31st of October there were in the country 4,930 national banks; of this number 1,134 were in process of liquidation, leaving at that date 3,796 in operation. These banks are banded together in what is called a national association. Their interests are identical, touch one and you touch them all. The national bank scheme was one of the happiest ever devised for making money easily, continuously, and in sums to suit the most rapacious ambition.

These 3,796 national banks have capital stock amounting to \$695,558,120, represented by 7,450,000 shares and held by 300,000 shareholders. Putting the best possible face on this money power, 300,000 persons dictate the financial policy of 65,000,000 of people; that is to say, less than five persons in every 1,000 impose any burdens they please on the other 995 persons, and this privilege is conferred upon this select few by the aid of the votes of workingmen.

These 3,796 national banks have \$224,327,350 invested in U. S. bonds, upon which they draw interest at the rate of 6, 2 and 4 per cent, yielding annually \$8,660,237. Deducting the investment in bonds, \$224,327,350 to secure circulation, and govern-

ment deposits, on which the government pays interest, and they have of their capital stock remaining \$471,230,770 to loan out at rates of interest ranging from 6 to 10 per cent, the rate averaging, probably, 7 per cent.

Of the \$224,327,350 U. S. bonds deposited with the government, \$209,416,350 is to secure their notes issued to them by the government, amounting September 30th, 1893, to \$209,214,166. It will be well to remember just here that the government pays the banks interest on the bonds deposited to secure the notes issued, that is to redeem them when called upon to do so, and the banks receiving the notes loan them out at rates of interest, as has been stated, of from 6 to 10 per cent., averaging 7 per cent. By this it is seen that the national banks by investing \$695,558,120 in capital stock, they have \$904,560,280 bearing interest as follows: Bonds, \$209,214,350; notes to loan, \$209,214,166, and the balance of their capital stock after purchasing bonds to secure circulation, of \$486,131,770, of which the notes, \$209,214,160, is absolutely a gift of the government.

But this is not all. On the 31st of October, 1893, these banks held \$1,451,124,330 of individual deposits, and government deposits amounting to \$14,322,573, or a total of deposits amounting to \$1,465,446,903. If to this amount is added surplus capital after purchasing bonds to secure circulation and the bills issued by the government upon these bonds, we have a grand sum total of money controlled by these 3,796 banks of \$2,160,842,839. More than the entire sum of money of all descriptions in circulation in the United States, and if 33 1/3 per cent. is kept on hand as a reserve to pay individual depositors, the remainder amounts to the enormous sum of \$1,440,561,892, upon which the people pay an average of 7 per cent., or an annual interest tribute of \$100,839,332. This is what may be styled a money power, created, fostered, protected, and perpetuated by law, and workingmen who rightfully complain of the degrading power of combined capital, have been for years voting to maintain this money power. This money power has controlled both national and state legislatures.

It has corrupted cabinets, congressmen and senators. It has corrupted state legislatures and courts. Its crushing power has been felt by all classes, but upon none has it fallen with such disastrous consequences as upon laboring men, as is seen at present from the center to the circumference of the country.

The national banks, as is seen by the sum total of the money they control, can make money scarce or plentiful as it may suit their purpose. To use common phrases, they can make money "tight" or "easy;" they can create a panic; they can topple over commercial or industrial enterprises as the whim may take them. Their managers constitute the plutocratic class, and they have been known to threaten the government if their demands were unheeded, and still in numerous ways too devious to be traced, the national banks, always with more than a billion of cash under their control, are doing things which, could they be laid bare to the naked eye, would create universal dismay, and the wonder would be, why such money machines for creating wealth and poverty were ever created, and still greater amazement that they are permitted to exist.

It is often said by those who advocate the national bank scheme, that they give the people a sound and stable currency, intending to be understood that, but for the national banks, a sound and stable currency could not be had. Nothing more fallacious and false could be stated. A national bank bill is good simply because the government is behind, and the same is true of the "greenback," the silver and the gold certificate, all of which are as sound as the national bank bill. The bank confers upon its bills no value whatever, it is the government. But it is held that because national banks are creatures of federal law they are entitled to special favor and consideration. Such a claim is utterly valueless. The records show that some of the most stupendous frauds and villainies the country has known have been perpetrated by national banks, and the fact that the federal examiners of national banks for the purpose of keeping them straight, have at last come to be regarded as a danger rather

than protection, since from collusion or ignorance, examinations and reports of examiners in numerous instances have aided rascals to perpetrate astounding frauds.

But aside from such reflections, the point we make is, that the national banks constitute a colossal money power, a consolidated, resistless power which ought not to exist, but which does exist by virtue of law. To get rid of this consolidated power votes must be cast for men who are opposed to the power, and it is just here that the question arises, will workmen continue to vote to perpetuate this organized, consolidated and invincible power? If they conclude that such a power is a menace to liberty and to their own welfare, they will be required to go into politics and vote for men who will advocate measures to dethrone this money power. Will they do it? The question is up for debate.

#### THE CRY FOR STATE HELP.

In the *May Forum*, we find two articles (1) captioned "Necessity of State Aid to the Unemployed" by Dr. Stanton Coit, (2) "The Dangerous Absurdity of State Aid" for the unemployed, D. Mc. G. Means.

In these two articles, reasoning and conclusions differ widely. Every observation seems to have been made from stand points which were so remote from each other, that, what one saw, or thought he saw distinctly, was totally obscured from the other's vision. It is a case in which both cannot be right but in which both may be wrong. Dr. Coit advocates state, or municipal, aid because "hunger undermines and destroys the will power and intelligence of a man more rapidly than support by charity;" hence, "men are wrong who prefer starvation, as they do to begging," and Dr. Coit further remarks that "we must not forget that to feed the able bodied and to clothe them still allows next to the worst of all calamities to fall upon them and crush out their manhood." Here is a dilemma. "Men are wrong" says Dr. Coit "who prefer starvation to begging." and men who beg lose their manhood, or it is "crushed out of them." What is best for the idle man—starve, or have his "manhood crushed out of him?" It were far better to starve than to lose one's manhood. The Dr. further says, "The moment idle-

ness, though at first enforced, becomes by habit agreeable, that moment a deterioration, a decay, of a man's character sets in at the very root," and, according to Dr. Coit, it requires only eighteen weeks to reduce an idle man from respectability to "loaferdom, drunkenness, vagrancy and crime." Therefore, says Dr. Coit, "it is evident that there is only one wise method of bringing relief to the able bodied unemployed," and that is "giving wages in return for work." That solves the problem. But, unfortunately, not more than one out of every hundred can find the work and the wages, for he says, referring to conditions in New York City, where an effort was made to supply "relief work" to the unemployed, "it has been heart-rending to have to turn ninety-nine away for every one man to whom we could give relief work, yet this was the ratio at which employment was found for the idle by the New York relief committees." Hence the conclusion that ninety-nine out of every one hundred were forced into "loaferdom, drunkenness, vagrancy and crime."

As relief committees could not find work for the idle, and as private individuals had no work, or not sufficient work for the idle, it became a fierce, a terrible necessity for the municipality (the state) to come to the rescue, and find work for the idle. If this is not done, then the state or the municipality must face conditions armed with teeth and claws, to do what imperatively requires an immensely increased armed force of police, deputy sheriffs, deputy marshals and soldiers, all to be paid by the state out of funds obtained by taxation. To kill the idle reduces the number to be fed and clothed; as many as are killed are out of the way; "subsequent proceedings interest them no more." It costs something to bury them even if they are buried like dogs, but the wounded must be cared for; our Christian civilization of bullets instead of ballots, is still sufficiently vigorous to saw off legs, set splintered bones and bandage the wounds of the idle as they by degrees sink to "loaferdom, drunkenness, vagrancy and crime." To arrest them, try them, convict them and send them to prison, is also expensive, and after all the poor devils have to be fed and clothed by the state. True,

they can be set to work in prisons, whereby a gang of contractors get rich, and prison made goods are forced upon the markets at prices which create idleness and supply more candidates for "loaferdom, drunkenness, vagrancy and crime." Hence, as a mere economic proposition, would it not be better for the state, for cities, to find work for the idle, though money had to be borrowed to pay the wages?"

Mr. D. Mc. G. Means takes no stock in such a theory as Dr. Coit advances. It is not required, in referring to the *Forum* articles, to do more than tersely state the main points of the positions: Dr. Coit advocates state aid to give the idle work and wages. Mr. Means asserts that to invoke state aid to give the idle work and wages, is both dangerous and absurd.

It may be well to say just here, that just in proportion as the number of the idle increases danger increases, and if the number of idle men have reached a sum total so great that opportunities for work and wages are not sufficient to meet requirements, then in such a contingency any effort on the part of the state or municipality to meet the deficiency, is both wise and prudent, rather than absurd, unreasonable or ridiculous—indeed, the danger and the absurdity attaches to a policy which denies work and wages to idle men.

Mr. Means indulges in sweeping assertions, designed to belittle the startling facts which confront Americans on every hand, relating to the vast number of the unemployed. We do not hesitate to admit that there is a large number of men out of employment voluntarily, who could, if they would, immediately resume work, provided they would accept wages, which, though perhaps sufficient to keep protesting and agonized souls in famished bodies, are nevertheless the wages of slaves and not of free men. We shall not attempt an argument to disprove that labor organizations are animated by the spirit of true and patriotic Americans in striving to maintain wages at a point that will furnish them simply a respectable living, and therefore refuse to work for wages that brings upon them degradation and makes labor a hissing and a by-word in the mouths of men like Mr. Means. We willingly admit there are such

American workmen out of employment, and American liberties and American institutions have no firmer guarantee of perpetuity than is found in this resistance to wide spread national degradation.

Mr. Means boastingly points to the fact that the consumption of coal, so necessary to the country's prosperity, is in active demand, and points to the fact as a standard by which to measure industrial prosperity, but he fails to ask the pertinent question: Why should, say 400,000 miners, be degraded to pariahs, to peons, to helots, that those who use the coal may riot in luxury? If coal is so essential, why not pay those who dig it at the peril of life and limb, a fair price for their work? We do not overlook what Mr. Means says of the building trades, the members of which in the city of New York champion rates of wages that rescue them from lairs, and their lives from a perpetual horror. But aside from such cases, there are a vast multitude of men, who are idle, made so by no fault of their own, by circumstances and conditions they had no hand in creating, but who, on the contrary, are the victims of circumstances and conditions *created by the state, by the government state, federal and municipal.* These victims of usury were at work in factory, shop, forge and mine—in enterprises of transportation by sea and by land—when, suddenly and without warning, by the effect of vicious legislation, multiplied thousands of workmen were forced into idleness. The state, by which we mean legislation, was responsible for the calamities. The rich controlled the state. The state was bribed and debauched, and for the ills which now afflict vast numbers of workmen, the state is chiefly responsible. This being true, what is the duty of the state? If the United States, or any of its great cities, like Canton and Hong Kong were in the grasp of the "black death" plague, and hundreds were dying daily, the state would promptly furnish aid. The state has set the example already when some great calamity has befallen communities, though the visitation was caused by what is technically termed, the "act of God," by furnishing aid, and now, when multiplied thousands are idle, and are rapidly descending, as Dr. Coit says, to "loafing, drunkenness, vagrancy and crime,"

the obligation of the state to come to the rescue is demanded by every consideration of right, justice and humanity. The danger lies in refusing, not in granting the aid. Just how states or cities could provide the necessary work, it is not required that we should point out, ways to do it are numerous. The proposition is not impractical, and where there is a will there is a way, and that way is far preferable to calling out the military, both an expensive and a murderous way.

The first step should be taken by the general government, because there is the highest authority for saying, that the general government, the supreme state, is chiefly responsible for the devastating causes of idleness with which the country is afflicted. This state aid, let it be understood, is not advocated as a fixed policy to be continued indefinitely, but to meet an emergency to rescue citizens, who have been forced into idleness, from lives of vagabondage—something worse than death.

#### WHAT MINERS SAY.

Some weeks since, three men, representing the coal miners at Streator, Ill., sent to Gov. Altgeld a communication deprecating the power and the piracies of corporations. They said:

"They (the corporations) oppress and wrong the people, and the state clothes them with the power by which they do these things. They anticipate demands and take possession of opportunities, and there seems to be nothing left for the people but to do their bidding. The state having made them powerful for the creating and the gathering of wealth away from the many towards the few more fitted and crafty, can not the state devise a way by which they can be used to serve honorably and profitably the less fortunate many, upon whose patriotism the state needs must depend? We find ourselves unable to cope with our surroundings, and we view with regret our growing dissatisfaction and rebellious spirit. We are practically denied the right of contract, and we daily witness the departure of our personal independence and consequent decline of our ambition and manhood."

Our literature, from the farmer's almanac, to volumes of political economy, by authors great and small, is filled with dissertations on money and morals, riches and rascality, land and larceny, poverty and progress, plutocrats and penitentiaries, and yet, we fail of remembering in any publication, in any lecture or address, in any speech in congress or elsewhere, or in

any message of president or governor, anything better calculated to arouse reflection than the foregoing extract from a communication to Governor Altgeld, written by Joseph Morgan, Robert Billsbury and L. Lewis, three Streator coal diggers chosen by coal diggers to present their case to the Governor of Illinois.

The statement that corporations oppress the people, will not be contradicted anywhere—the fact is known and read and believed, and no class of people have been so outraged by corporations as coal miners. And the state creates these corporations and clothes them with power to oppress the people. The state and the corporations are in alliance. The state sees its citizens robbed, crushed, impoverished and degraded, and makes no effort to remedy the wrong—until, finally, the conclusion is that the corporation is the state, and uses its money power to corrupt and debauch legislatures, as the sugar trust uses its power to debauch the United States Senate till that august body stinks in the nostrils of the nation. The miners say they are unable to cope with their surroundings; that is to say, they must go down to degradation with a wail in their throats—their high ambition thwarted and their manhood destroyed. What then? Vagabonds and slaves. The picture is repulsive—it is full of terror—but it is true to fact and to life and the lines are growing darker every day contemplating such conditions, the corporation grinding like the mills of the gods and defying the state, or more properly, in partnership with the state, what more natural than that crime should increase? To show the ratio of the increase of crime in the United States, it may be well to reproduce the remarks of President Brinkerhoff of the National Prison Congress which was recently in session at St. Paul. The figures are startling. President Brinkerhoff said:

"That crime is on the increase out of proportion to population is indicated in many ways, but for the country as a whole the United States census is the most reliable guide. Let us look at it by decades:

Year.	Prisoners.	Ratio of population.
1850 . . . . .	6,737	1 out of 3,442
1860 . . . . .	19,086	1 out of 1,647
1870 . . . . .	32,901	1 out of 1,171
1880 . . . . .	58,609	1 out of 855
1890 . . . . .	82,329	1 out of 757

This rate of increase, in a few states, we are glad to note, has not been maintained, and in one or two for the higher crimes, has even decreased a trifle, but upon the whole the swell has been continuous like a tide that has no ebb. When the waters of the Mississippi in a flood mount up to the danger mark every one knows that unless they halt disaster is inevitable. So with the floods of crime, we are past the danger line and there is no ebb. If this increase is to be continued the decades can be counted upon the fingers of a single hand when *Mene, Mene, Tekel, Upharsin*, will be written upon the banquet hall of the republic."

There is nothing more natural than that crime should increase, and when the figures are presented, showing the increase from 1880 to 1900, the nations will stand aghast. The corporation curse, worse than the black death in China, is upon the country—and the state creates the curse. Well said President Brinkerhoff, if this curse proceeds for another forty years, as it did from 1850 to 1890, "*Mene, Mene, Tekel, Upharsin* will be written upon the banquet hall of the republic," and what is the meaning of the terrible words? "*God hath numbered thy kingdom and finished it.*" "*Thou art weighed in the balance and found wanting.*" "*Thy kingdom is divided and given to the Medes and Persians.*" President Brinkerhoff is of the opinion that unless there is an *ebb* in the flood of crime, the country is doomed. Poverty is the parent of crime. Corporations, say the Streator miners, "oppress and wrong the people." They tell the truth. The state creates the corporations, but does not restrain them. Oppression and wrong breed criminals. Who can stay the skeleton hand like that which wrote upon the plaster, Belshazzar's doom and the doom of his kingdom? The corporation is banqueting in gilded palaces, and the wealth which purchases their vice and their luxuries is wrung by "oppression and wrong" from their employees. We need a change of rulers—honest men in office, men who will extract the fangs of corporations and blunt their claws and restrain their rapacity. Can we have the change? Yes. How? By wielding in the interest of right and justice the all conquering weapon, the ballot. Will workmen use the ballot for that purpose? If they are wise they will.

### The Heart of the Labor Problem.

MR. EDITOR:—The MAGAZINE for May contains an editorial captioned, "The Labor Problem," from which is to be understood, as a general principle, that labor cannot expect to gain any advancement of its own interests by a study of political economy or the science of government, or by taking an active part in politics; and that all its power should be used to solidify, unify, and federate, so as to secure honest, fair wages. No member of labor's ranks can offer any objection to unifying, solidifying, and federating, as labor organizations, so as to secure honest, fair wages; but the man who thinks that this alone will solve the labor problem is sadly mistaken.

There are more laboring men and women in this country to day, by millions, than there are jobs for, and, consequently, men are roving over the country like a band of vagabond, masterless dogs, existing by charity or theft, some of them on the way to the national capital in the form of a "petition in boots," to beg or demand employment of the government—something it cannot give them, unless it robs somebody else to do so. Nevertheless, it may do this, for it is a good hand at the robbing business: How can these unemployed, homeless, penniless outcasts unify, solidify, or federate so as to compel anybody to give them employment at any wages, to say nothing of honest, fair wages? And how can those who are lucky enough to have employment unify, solidify, and federate as close as they may, compel capitalists or others to open up industries for their employment, or maintain honest, fair wages for themselves in the face of so many idle men who are eager to work for merely enough to keep soul and body together? They must, however, in such a situation, do one of two things, either of which will reduce their wages. They must support the idle men by contributions, or accept the wages for, which the idle men would go to work.

The latest news from Cripple Creek, this state, where a hot fight has been going on between the miner's union and the mine owners for honest, fair wages, with deputy sheriffs to assist the mine owners and the militia to preserve order, is to the effect that the strike is settled on these terms: The miners are to get three dollars a day for eight hours' work, and the mine owners have the right to hire non union men.

It requires no very brilliant mind to see that that is a practical defeat for the union. And so it must ever be as long as men have to remain in enforced idleness: and there will be men in enforced idleness so long as our present political and economic system is allowed to stand.

"We hold," says the MAGAZINE, "that, primarily and fundamentally, the labor

problem involves wages, and that when wages are adjusted upon a basis of justice, the labor problem is practically solved." No, not "practically," but absolutely solved, Mr. Editor, for when justice is done, all is done that can be done by man or nature. But what is a basis of justice? Can justice be based upon anything but the law of equal freedom? And can the law of equal freedom exist, or be practiced, under such laws and institutions as we have to-day? Surely not. How, then, can we, under these conditions, secure fair, honest wages? How can we tell what they are? We can never ascertain what they are by any artificial standard of measurement. Nature has furnished the true standard by which alone wages can be measured, and whenever man interferes with that standard injustice results and disorder and misery follow. Fair, honest wages is all that a man can or will produce under conditions of equal freedom, in which he has free access to the natural elements from which all wages, and everything else, is produced, which he can retain for himself, and not be compelled to part with any portion of it to support plutocracy or monopoly. Evidently, then, honest, fair wages can never be obtained except by free access to nature's resources and the enjoyment of the right to freely trade the products of one's labor with all others who may wish to trade with him.

The MAGAZINE says: "The day a workingman receives what he believes to be just wages, with him the labor problem is solved; and it never will be solved until just wages is secured. If this is true, and we challenge denial, why waste time and breath over minor questions? Why clamor for the single tax? Why run mad over nationalism, another term for paternalism? Why resolve to go pell mell into some new fangled political party? Why get hoarse over the initiative and referendum?" It often happens that we believe things that are not true, and our believing them will not make them true, for no amount of belief will alter the nature of fact; so that no matter how strong a workingman may believe that he is getting fair wages it will not make him to be getting it, any more than a belief on the part of a slave that the institution of slavery was right made it so, nor will such a belief solve the labor problem for him who holds it, nor for anybody else, because it is error, and error can never perform the functions of truth. We clamor for the single tax because it is right and simply just, and the only thing that will ever solve the labor problem; for it is the law of equal freedom, is scientific, and, therefore, absolutely correct. We clamor for it because it will procure for every man the entire product of his labor, which is his

"honest, fair wages," and we know that nothing else will do it; and because it will prevent the millionaires escaping taxation on all but five per cent. of their property, thereby throwing the burden of support of government upon the poor man who is taxed upon ninety-five per cent. of his property, as is shown by the *Chicago Times* and editor Stead, in his book, "If Christ Came to Chicago," to be the case in that city, and every intelligent man knows that it is only a type of all other cities. We grow hoarse over the referendum because it also is right, and because we who grow hoarse over it hate this slave-breeding government which is neither more nor less than the tool of plutocratic thieves and robbers that they use in their nefarious operations of beating down labor to the earth and taking from it that which it has produced, and which belongs to it only. We hate it with that intense hatred which all liberty-loving persons, who know what freedom is and what it means, must feel for all forms of oppression, tyranny and slavery. We grow hoarse over it because we want, in fact as well as in theory, a government of the people, for the people, and by the people, instead of a government by monopoly, plutocracy and thieves; and because we want to vote directly for our laws and know what they are; so that we can live up to them and thereby avoid litigation of all sorts, and the support of hordes of thieving lawyers and prostitute judges, which are merely so many clubs in the hands of our soul, body and freedom murdering masters.

I quote again: "Why should labor writers and speakers be constantly repeating the stale platitude that 'capital has rights as well as labor'?" Because they are ignorant of the truth, or else too cowardly to speak it. They are mere bread and butter speakers and writers, and are, therefore, false guides for men who are seeking the truth, and are sure to lead them to their destruction. And such leaders and speakers must soon step aside and give way to the genuine article. The blind have followed the blind, or hypocritical, who have led them in a circle within the corral fence of slavery long enough to their own injury. The demand is now for leaders, speakers, and writers of principle—men of loftier minds, nobler sentiments and a higher order of intelligence, having clear knowledge of the truth, who will break down the slave pen fence and lead us out into the middle of the road to freedom, and keep us marching therein until we reach our proper goal—liberty. Such men will have millions for principle, but not a cent for policy, and all intelligent men will fall in line behind them. There is no scab in this country today whose conduct is more injurious to the rights and interests of labor and labor

unions than the workingman who cannot or will not study the science of political economy and government. I make no exceptions.

P. W. Monahan.

GRAND JUNCTION, COLO.

### THE CHARITY BALL.

Have you ever attended a charity ball. Where a parvenu crowd ruled the roost in some hall. 'Mid the blare of the music and sound of the gong. Tripping lightly the gayly fantastic along? If you haven't then list, and in second hand style I will angle about for the edge of a smile. As I sing you some sights that were witnessed by all. On the memorable night of our charity ball. They were panicky times, and the lowly and poor Needed clothing and food. How was best to secure A sufficiency worried the brains of us all. Till by vote some agreed on a charity ball. There was deafening applause. Antediluvian toes Soon were limbered for whacking the floor with their blows. Then the price of admission was fixed, and the night Of the ball they were full of the greatest delight. When the strains of the orchestra floated along. Oh, they ravished our souls like voluptuous song; And the grand march was started by Reginald Revere. And his wife in the lead—they are venders of beer—Close behind them came Andy McNulty and Jane. People say in their spite: "She is touched in the brain." Jennie Skinner and shop-lifting Judy of yore. Floated by with their feet scarcely touching the floor. Jerry Ferguson marched with the widow Lerone. In their footsteps came Tommy and Bella Malone. Billy Edwards, the butcher, and "Foxy the hog." With their wives came along at a bog trotter's jog. Phillip Fraser, the artist, and Nettie McGee Passed unapologetically by, praising this our first spree. Charley Maxwell and Jennie next strode on the floor. So conceited, forgetful of when they were poor. To and fro, here and there floated couples about. Every nabob we had in the parish was out. Hattie Flatfoot, Kit Down, Jule Somers and Nell And their partners—their names I'm unable to tell. They were queens—in their minds—and they mimicked the style Of the fashion plate pages. Each one when she'd smile Thought the sun had just risen, so rank was her gall. On that night of all nights at our charity ball. When the frolicking ceased and the eating begun. Holy Moses, 'twas then we had elegant fun: Some had napkins tucked under their chins and some more Dropped them off from their plates 'neath their feet on the floor: Some would slaughter the victuals and eat with their knives. And some husbands, the idiots, would spoon feed their wives. Some with forks picked their teeth, and the most of the crowd Would make Hottentots say they were vulgar and loud. They let etiquette go to the devil, and I Didn't care any more on their actions to spy. They again took the floor, and they belted away In the waltz and quadrille till the dawning of day Ere they parted they gathered around in a ring. And by vote they decreed every year they would bring out their forces again in response to the call Of the friends of the poor for a charity ball. Dress-parading themselves was their chiefest desire. Little cared they if victuals or raiment or fire The receipts of the blow-out would largely procure. For the least of their thoughts were bestowed on the poor. But who wore the best silks and the costliest lace And the richest of sables with stateliest grace. Was a matter which filled them with envy and scorn. Going home full of gossip and hate in the morn.

Shirley Morgan

### Just a Few People.

The census bureau took from every family in 22 states and territories answers to the questions whether it owned or hired the farm or home occupied, and the extent of the incumbrance on owned farms and homes, if any, with the value of the property. The results are believed by the *Springfield Republican* to be fairly representative of the whole country. Assuming this to be so, 32 per cent. of the farm families and 63 per cent. of the home families in the country are tenants. Among farm-owning families 30 per cent. carry mortgage debts averaging \$1,130 on farms whose average value is \$3,190; among home-owning families 29 per cent. carry incumbrances averaging \$1,139 on homes valued on the average of \$3,254. The census will show the number of farms to be about 4,500,000, leaving 8,196,152 families occupying homes that are not farms. Mr. Holmes confines his wealth estimates here to properties valued at less than \$5,000. Such farms encumbered constitute 80 per cent. in number and 52 per cent. in value of all encumbered farms, and such encumbered homes constitute 82 per cent. in number and 46 per cent. in value of all encumbered homes. The census did not take the values of unencumbered farms and homes, and the percentage in the other case are adopted here as probably the truth.

According to the estimates tabulated by Mr. Holmes, 91 per cent. of the families of the country own no more than about 29 per cent. of the wealth and 9 per cent. own 71 per cent. of the wealth. And Mr. Holmes believes his estimates do not overstate the case against the poor. These conclusions are about as dubious as any which have been reached in the study of this question. Proceeding to divide the richer 9 per cent. of the families as between the rich and moderately well off. Mr. Holmes takes the *New York Tribune's* list of millionaires (4,047), and gives them an average of about \$3,000,000—this estimate being also partly based upon the results of Thomas G. Sherman's claims in the same line. This gives to the 4,047 very rich families or three hundredths of 1 per cent. of all the families, about \$12,000,000,000 or 20 per cent. of the nation's wealth, and leaves the remaining property of the nation (51 per cent.) to 9 per cent. of the families, including the comparatively few millionaires. The result seems incredible to Mr. Holmes. That 4,047 families should possess nearly as much wealth—seven tenths as much at least—as 11,593,887 families is, indeed, rather startling. But it is probable, he contends, that the statement is approximately correct. Excluding the millionaires, the wealth of the 1,092,218 families lying between them and

the great mass of people holding property valued at less than \$5,000 becomes an average of \$28,000 a family, which seems large for so many, but which, Mr. Holmes goes on to demonstrate, must be about the case. —*Detroit News*.

### An Innocent Crook.

A few days ago two men were arrested for smuggling opium, says the *Chicago Herald*. Similar business has been of frequent occurrence, and the almond-eyed celestial is quite often the beneficiary thereby, since he is able to buy the article when it is in the hands of the government much cheaper than he would under any other circumstances. The two men in question, it seems, had been run to cover through information given by the celestial. After the case had been made against the brace, one of them said to an officer:

"Well, it serves me bloody well right for goin' into such a t'ing. See? I was roped in and I took to it and give up a good, legitimate business that I was in, and here I am, bloomin' idiot that I was."

The fellow's manner indicated a sincerity which interested the custom house inspector and he asked the man:

"What was the legitimate business you were in before you made this false step?"

"Liftin' pocketbooks, sir."

When the time came to hand them over to the lockup the inspector said to the same fellow: "This is a pretty good valise you had that opium in, and as I am shy a valise I guess I'll take it, as you will have no use for it for a while."

The man looked at the inspector and said in a pleading way: "Say, don't do it. Don't take me trunk. I has reasons for keepin' it. When I git out of this scrape I'll pinch you one that'll suit you as well."

### A Heavy Strain.

Wife—Is my husband's condition serious?

Doctor—Rest will cure him. He is suffering from brain strain.

"There! I told him he ought to hire a real estate agent to do it."

"Do what?"

"We concluded to let our country house for the summer, and my husband insisted on writing the advertisement himself." —*New York Weekly*.

### Caution Necessary.

Grateful Customer—I am glad to see you keep your hands as well as your razor scrupulously neat and clean.

Tonsorial Artist.—Yes, sir. We're obliged to. A barber never can tell when he's in danger of catching the measles or something of that kind from a customer. Sham-poo, sir?—*Chicago Tribune*.

**OLD JONES, PLOWMAN.**

Across the cornfield marched old Jones,  
And as the plough cut through the furrow,  
He sang a hymn in dulcet tones  
That sent the chipmunk to his burrow:

"U-l-las 'n did my Sa-vyer blec—  
Dand 'id my suv-ren di-ee,  
Woe de devote that sacred h—  
nation!"

The solemn crow flew o'er the field.  
Nor paused to hear the language spoken;  
But glad sunlight the cause revealed—  
'T'pon a root the plough had broken.

Another point is set in place,  
And once again sweet hope is springing—  
Old deacon Jones, the soul of grace,  
The solemn stave once more is singing:  
"Wah zit fur crimes tha ti have done  
He groaned upon that tree-ee?  
U-n-ma zing pit-tee gra sun none,  
An dove beyond—!"

The bluejay screams his wild delight,  
The blacksnake hides amid the brambles.  
By the fierce language put to flight,  
The gray squirrel up the chestnut scrambles:

For sin is lurking in the path,  
As roots beneath the furrow hiding,  
E'er ready to distort with wrath  
A faith the firmest, most abiding.

So sang old Jones—and so may we  
Go singing down life's yielding meadows,  
Our faith turn skyward, just as he—  
Nor fear the touch of sinful shadows.

But when the trial comes, ah, then  
We fall, like Jones, and raise a ruction;  
And rave, and roar, like other men,  
Whene'er life's plough meet an obstruction.

—Cleveland Plain Dealer.

**Black Snakes are Fond of Wild Cats.**

"If it hadn't been that there was a bounty of \$2 a head on wild cats then," said Uncle Joe Vondersmith, of York county, Pennsylvania, "it wouldn't have cost me a cent to learn that blacksnakes were fond of wild cats. As it was, it cost me \$20. But I s'pose the knowledge I got was worth the price.

"I used to peddle through the lower counties and down through Maryland. Those are great districts for snakes, especially blacksnakes and copperheads. It's fun to see folks doing their haying down through there, especially when they're loading it after it is cut and cured. A man will take up a forkful of dried grass, but he won't pitch it on the wagon right away. He gives it three or four peculiar shakes to rattle the snakes out of it. If four or five copperheads don't tumble out the man ain't satisfied, and gives the hay another shake. It's worth going a long journey to see 'em load hay down there.

"They never speak about big blacksnakes in that country. There's no use of it, because there ain't any little blacksnakes. At least you never see one, unless you call one nine feet long a little one. They don't run much finer than that. If one is killed smaller than that it is toted around as a

curiosity. It was in that stretch of territory that I learned to talk intelligently about the partiality of blacksnakes for wild cats. I was driving along one day through a scrubby piece of woods near the York county border, and hearing a peculiar noise at the side of the road I got out of my wagon to investigate. In a hollow stump I found nine wild cat kittens almost as big as full grown house cats.

"Ha! ha!" I says. 'Here's \$18 for me, sure enough!"

"While I was busy appropriating the scrambling and scratching young cats, out of the woods came the mother of the litter, and made right for me. I put two or three pistol balls into her, and that was all there was of the fight.

"Have to call it \$20, now," I says, and I tumbled the old cat's carcass into the wagon, and put the nine kittens in by her. They snuggled down meek as mice, and I started on, feeling good.

"I had gone a mile or so when I happened to look back along the road and saw a big black streak coming toward me like a hurricane. I knew what it was in a second. It was one of the famous blacksnakes of that district. I put whip to my horse, thinking I might get away from my pursuer, but I didn't know the qualities of those snakes. This one closed up the space so fast that he was almost at the hind wheels of my wagon before I had run five rods. I thought, of course, that the snake wanted me, and I quickly turned over in my mind what was best to be done to save myself. Having often read of travelers pursued by wolves tossing dogs and other things from their sleds as sops to the wolves, thus gaining time and distance, a happy thought struck me and I grabbed a wild cat kitten and tossed it out to this snake to see how it would work. It worked first rate. The snake stopped. I whipped up my horse. Looking back I saw the snake getting ready to envelop the kitten, and I thought I was saved. But just then out of the woods at one side of the road whizzed another blacksnake as big as the first and went to climbing right up into my wagon. I grabbed another kitten and chucked it out, and had to groan a little, for it was another \$2 contribution to snakes.

"Then away I went again, hoping to save the rest of the prize money. By and by I looked back to see how the land lay. It wasn't laying at all. It was all torn up by four more immense blacksnakes, which were putting in their best licks to catch me, not more than one hundred yards in the rear. I threw another kitten out supposing the four snakes would stop and have a squabble for it. But they didn't. One got it, and the other three came right on. And more snakes came out of the woods and

joined in the chase. I saw it was no use, and so I stood up, my horse going at full jump, and fed them snakes wildcat kittens until the whole nine were gone, and I was \$18 out.

"I was pretty near out of the woods by this time. I could see the clearing right ahead.

"I'll save the old dead cat, by gum!" I says, "and clear up \$2 out of this, anyhow!"

"But I was overhauled by a tremendous big blacksnake before I got to the end of the woods, and I knew by the hump on him that he had at least two of the kittens inside of himself already. I had to give up the old cat, and went out of those woods into the clearing a humming. I looked back and saw the whole caboodle of snakes having a grand old rough-and-tumble over the body of the mother wildcat, but I didn't stay to see how it came out. So I found out by personal observation that blacksnakes are fond of wildcats, but it cost me \$20."

#### Something of a Flat Spot.

General Superintendent Bradley, of the West Shore, tells an amusing story of his early railroad life.

It was out in western New York, and in the days of iron tire.

Old Judd Morrell was running an old pelter that had been shimmed and flattened until she rode like a tin peddler's wagon on a corduroy road. The superintendent, who is now vice president of the C. & E. I., got on the engine one day and sat down on the cushionless seat for a ride.

When they got to going pretty lively the engineer stood on tip-toe to lessen the jar, the fireman went out in the tank and the superintendent's hat danced around on his head like a green boy on a trotting horse; finally, he leaned over toward old Judd and said:

"Judson, isn't this track pretty rough, or has she got a flat spot in her tire? Don't seem as if her wheels was round?"

"Round!" yelled Morrell, "Why, sir, her wheels ain't no nearer round than the state of New Hampshire!"—*Locomotive Engineering*.

#### Wanted it Long.

Farmer Wayback—"I promised my boys I'd buy 'em a few bicycles ef they don't cost too much."

Dealer—"Well, here is a fine one at \$95."

"Wha?"—"The one next to it is \$80, the next to that \$75, and so on. The farther we go along the row the cheaper they get."

"Say mister, how long is the row?"

"The length of the store."

"Waal, ef your store is 'bout half a mile long I'll walk on with yeh."—*Good News*.

#### Was all Fixed.

The gander-legged young man in a sky blue necktie came hurriedly into the squire's office and laid a legal document before that potentate.

"Is that paper negotiable in this market?" he inquired anxiously.

The squire looked over it long enough to determine in his own mind that it was a marriage license.

"I suppose it is," said the squire, "but it cannot be validated, so to speak, unless the party of the second part is present."

"You mean the gal?" asked the negotiator, more nervous than before.

"I do."

"She's all right; she's outside in the wagon holdin' the hosses."

"You don't expect me to go out there to perform the ceremony, do you?" asked the squire, haughtily.

"Have you got the power to fix the business?" inquired the young man, apparently of the belief that the squire had to call in the police or a preacher or some other functionary.

"Certainly; I've got all the paraphernalia right here, handy; all I need is the girl."

"And the whole caboodle wouldn't amount to shucks without her, would it?" asked the youth, with a smile as happy as it was sheepish.

"Hardly."

"Shake, old man," exclaimed the Romeo, extending his hand. "Shake once for luck. I'll go right out and hitch the hosses and fetch in the gal, and you can hitch us. Here's 50 cents to show you I mean business," and he hustled out to hitch the horses preparatory to the other hitching.—*Detroit Free Press*.

#### Getting at the Facts.

Attorney—"You are the president of the Dazzling Sun Gas Co., are you not?"

Witness—"I am sir."

"Now, sir, for the purpose of getting at the exact facts in this case, I am compelled to ask you what it costs the company per 1,000 feet to manufacture gas?"

"That, sir, is a matter of no concern to you, and has nothing to do with this case."

"I insist upon knowing."

"I prefer not to answer."

(To the court)—"Your honor, it is absolutely necessary to get the figures."

The court—"The witness will answer the question."

"Now, then, I will ask you again, sir, How much does the manufacture of gas cost the company by the 1,000 feet?"

"I haven't any idea. I have nothing to do with the business affairs of the company, sir, except to draw my regular quarterly dividend of 5 per cent."—*Chicago Tribune*.

**AT THE TURN OF THE ROAD.**

Where the rough road turns, and the valley sweet  
Smiles bright with the balm of bloom,  
We'll forget the thorns that have pierced our feet  
And the nights with their grief and gloom;  
And the sky will smile, and the stars will beam,  
And we'll lay us down in the light to dream.

We shall lay us down in the bloom and light

With a prayer and a tear for rest,  
As tired children who creep at night  
To the love of a mother's breast;  
And for all the grief of the stormy past,  
Rest shall be sweeter, at last—at last!

Sweeter because of the weary way

And the lonesome night and long,  
While the darkness drifts to the perfect day

With its splendor of light and song—  
The light that shall bless us, and kiss us, and love us,  
And sprinkle the roses of heaven above us!

—F. L. Stanton in *Washington Post*..

**The Real Buffalo Bill.**

There lives at Wichita, Kan., the man who is rightfully entitled to whatever fame and honor belongs to the name of "Buffalo Bill." William Matthewson carried that title through twenty-five years' active service on our western plains and mountains, before the country west of the Mississippi was settled by the whites.

Mr. Matthewson is a hale and hearty veteran of 60, a quiet, unassuming man, who since his residence in Wichita in 1868 has been one of its most public spirited and influential citizens. In appearance he is not unlike the pictures of the typical "Uncle Sam." With the exception of a pair of eyes of eagle keenness, he is very unlike the popular impression of the western scout, Indian trader, and buffalo hunter. He is not at all given to talk of his exploits, but careful and interested questioning will thaw him out, and the listener will be rewarded by reminiscences enough to fill a book.

In answer to the inquiry of a writer for the *Great Divide*, Mr. Matthewson said:

"No, I have never written a word of my life for the public, although there have been one or two short sketches in the western newspapers. But, as to writing the history of my life, why, I should hardly know where to begin. And why should I? The trials and hardships which I endured in the early days were a part of the necessities of pioneer times, which I shared in common with the first settlers. If it has been my fortune to risk my life, it has always been in the endeavor to save human life and property. If I had thought of gaining any renown for the few good deeds I was fortunate to do, perhaps I might not have accomplished them. But the frontier man in those days was not thinking of making material for history or dime novels. He lived face to face with actual peril, and was too busy with the emergencies of the present to care for the curiosity of the future. I did, however, for fifteen years,

keep a diary of my daily life, as I lived in connection with Kit Carson and his party—the two Maxwells, James and John Baker, and Charles and John Atterby. I had the record of all our adventures through the Rocky mountains and country where Denver now stands, of our getting the Indians together to prevent them raiding into Mexico, of my life with Col. St. Vrain and Col. Bent, of all the years that I acted as Indian trader at the great bend in the Arkansas river, at Cow creek, and at the post on the Little Aankansas on the old Santa Fe trail. I had several memorandum books that would be priceless to me now burned when my ranch on Cow creek was burned in '64."

"Did the Indians give me the name of 'Buffalo Bill?' Oh, no, the white settlers gave me that title; not simply because I was a great buffalo hunter, but because they were grateful to me for saving their lives during a period of great scarcity. It was this way: In 1860 there was a terrible drought in Kansas, the crops having failed entirely. I suppose the people would have suffered some if I hadn't been a hunter.

"There were plenty of buffalo roaming the plains, but the Indians were thick and hostile and the settlers unused to Indian warfare. I took a wagon train and some men and set out for the buffalo grounds, and from September until February we killed buffalo and sent train after train to the famine-stricken people of western Kansas."

"How did William Cody happen to call himself Buffalo Bill?"

"Well, you see Cody worked for me when he was a young fellow—he is only about 45 now. I reckon he had begun to read Indian stories and see how much was to be made by that kind of a reputation, and he was always fond of talk and show. I never was any hand to wear my hair long and go swaggering about the country blowing about what I had done. I've had my hair get pretty long at times, but was glad to get it cut, when I could get back to a place where I could.

"Cody knows he has no real right to the name, but if he wants to show off as a dime novel hero I have no objections. I reckon seeing so many of those Indian lies has sort of disgusted me with talking about my adventures, though I've had about as many and thrilling escapes as any of 'em can tell."

Mr. Matthewson chuckled with the recollection of an amusing incident.

"After Wichita began to settle up with people coming in from everywhere—tourists sometimes—I have often had parties come out to my house to look at me, as if I were a natural curiosity. Once a lot of folks, some of them ladies, came out after I was in bed, and begged me to come out and talk to them. One of the ladies said:

'Is that Buffalo Bill? Why, he doesn't look like a dangerous man.'

"My God, madam," I said, 'I didn't know anybody thought I was.'

"I reckon she was disappointed that I didn't have buffalo horns growing out of my head."

The following incident is taken from the history of Sedgwick county:

"In the summer of 1864, on the 20th, 21st, and 22d of July, at Cow creek ranch, Mr. Matthewson and five of his men had one of the hardest and most unequal fights for three days that the annals of Indian warfare recount. At the end of three days of perilous hardship and desperate fighting 600 Indian warriors, well armed and mounted, were repulsed and forced to retire. After they were driven off they turned their attention to a large train composed of 135 wagons and 155 boys and men, who had formed a corral and gone into camp about three miles from Matthewson's ranch.

"The wagons were loaded with government supplies for the soldiers of Arizona and New Mexico. Their contents, however, were disguised. In the train were several wagon loads of the most improved arms, including Sharp's rifles and Colt's navy revolvers, but the teamsters and wagon-masters were ignorant of this. The owners of the train, Peck, Durfee & Co., of Leavenworth, had informed Mr. Matthewson of its contents, and this knowledge enabled him to save the train from complete disaster.

"In the fight at the ranch, after the Indians had been repulsed with great loss, they formed Indian fashion and made for the wagon train, which they surrounded, and began firing on the unarmed teamsters, gradually drawing in their lines. From the top of the stockade building, by the aid of a field glass, Mr. Matthewson studied the situation, and it only required a few minutes for his practiced eye to discover the peril of the train and to determine that unless immediate help was given the whole outfit must be massacred. He decided at once to go to the rescue.

"Taking his Sharp's rifle and six revolvers in his belt, and mounted on his celebrated mare Bess, he picked his way carefully through the tall grass and down a ravine until within 200 yards of the corral.

"The Indians were circling around fighting on horseback, and as all their attention was directed to the train they failed to observe him until he had passed through their line and in a moment gained the corral. With one leap the gallant Bess cleared the inclosure of the corral. Matthewson threw himself from the back of the noble animal and called for an ax, and in less time than it takes to tell of the affair he had mounted

one of the wagons and began splitting open the box and handing out rifles and ammunition to the men.

"Many of them knew him, and all had heard of his daring deeds. Cheer after cheer went up as they recognized their rescuer, and it was but a few moments until a well directed fire was turned on the now astonished and routed Indians.

"After continuing the fight for a short time and having many of their number killed and wounded, the Indians hastily beat a retreat. In the spring of 1866 the owners of the train, at a banquet given in honor of Mr. Matthewson, presented him with a handsome pair of revolvers, mounted with silver and inlaid with gold, as a token of their appreciation of his bravery."

Mr. Matthewson is one of the best Indian scouts employed by the government. He has been instrumental in managing several important treaties with the Indians. In 1855 he was sent by the government to gather together for a council the Kiowa, Comanche, Apache, Arapahoe and Cheyenne Indians. A treaty of peace was concluded in October, 1863. He entered into a private treaty with the chiefs of the different tribes, in which they agreed to allow him to come and go and trade among them, and he agreeing never to take up arms against them again. This treaty was never broken, although Mr. Matthewson has several times acted as mediator between the government and the Indians. In 1865 he pre-empted the quarter section of land on which his handsome residence now stands and built on it one of the first houses in the town—a log house, which stands yet on the banks of Chisholm creek, an object of interest to visitors who like to hear of the famous "Buffalo Bill."

Mr. Matthewson is wealthy and lives in a beautiful residence on Central avenue. He is a Mason, a Knight of Pythias, and an Odd Fellow, having been grand master of the state for three years.

He has the confidence and esteem of his fellow townsmen as William Matthewson, and that is more to him than notoriety as "Buffalo Bill."

#### Appropriate.

Sculptor—"I'm getting up a new statue of Franklin, and I want to indicate his discovery of electricity."

Friend—"Why not represent him with one leg, the other having been taken off by a trolley car?"—*New York World*.

#### Knew Him Too Well.

The Suitor (bitterly)—"You reject me? Why, some months ago I consented to wait until you could learn to know me better!"

The Girl—"Yes. That's where you made your mistake."—*Chicago Record*.

**THE BOY AMONG HIS BLOCKS.**

Building a castle fine,  
 With terrace, tower and wall,  
 And turrets that so brightly shine  
 Above the shadows tall;  
 But see! it sways, falls, past all cure,  
 For ah! the base is insecure!

Foundations must be firm  
 For superstructure's need;  
 They will stand the longest term  
 When built on noble deed  
 Such character, my boy, will stand,  
 And grow among life's wrecks, more grand.  
 —Anne E. Thomas, in *Harper's Young People*.

**They are Micawbers.**

On a corner of odd old Ann street, just where historic Theater alley cuts into the narrow and bustling thoroughfare, is a little saloon, old-fashioned as the oldest thing in the street, and one of the most interesting spots in its way in that street full of interesting things.

It is a store that was established away back in the '50s, and withstanding the rage for modern and elaborate fittings in such resorts, it clings to its ancient style of interior arrangements. The bar counter is antique, and along the east walls are arranged old wooden tables with wooden chairs. Liquors, bottled during the war times, are displayed on the back counter, and there are old-fashioned show-cases where other venerable bottles are stored. A sign, swinging outside the narrow entrance, which is built diagonally across the corner of the building, tells of its ancient origin.

Here meet daily, and linger from early morn until midnight, a knot of men who have been severally called the coterie of Has Beens and the happy family of Micawbers. They got these names because they all have been something in the world sometime, but now, like Micawber, buffeted and tired by the battle of life, they are simply existing aimlessly, waiting for something to turn up.

A stranger chancing to come upon the group unexpectedly, would be instantly impressed with the likeness of every one of them to familiar characters in Dickens' stories. He could spend an hour entertainingly studying their whimsicalities, for it would be a study of the eccentricities of brain and talent gone to seed, as it were.

The Has Beens rush in and out during the daylight hours with a tremendous show of pressing business cares. They send notes to one another, and are constantly having whispered confabs together, with looks of importance strangely out of keeping with the worn and rusty clothes that they wear. It is soon discovered, however, that all this bustle and nervous excitement is mere pretense, practiced as a sort of intellectual diversion or to mislead visitors who do not belong to the happy family.

The men really have nothing whatever to do, and are waiting, waiting, waiting for work that never seems to turn up. That they have brains is apparent to any one who stops to listen to their conversation as they sit at the tables. They talk glibly of better days, of their youth at college and of later enterprises. Their discussions usually take on a religious tinge. It is when religion is discussed, by the way, that they consider themselves in luck. For acquaintances who are better off in the world drop in at such times and set their tongues wagging with some degree of eloquence by setting up mixed ale, or some other comforting and cheering beverage for the coterie.

"Here's luck," cry the Has Beens, raising their glasses and tossing off the drink to the acquaintance who plays host.

Then begins the wonderful flow of reminiscence, some of it Munchausen-like in its exuberance of improbability. There appears to be a sort of secret agreement that none of these reminiscences shall be long. Every one of the Has Beens wants a chance of telling his own individual tale. The astonished listener hears that they are all housed in handsome flats up town or boarders at reputable hotels, who love to drop into this ancient hostelry on account of the wealth of old-time associations clustering about it.

Some are heirs, in these tales, to large estates, awaiting remittances from their lawyers, or owners of property tied up in litigation. Investigation will prove that the remittances never come, and that the boasted residence in fashionable flats and hotels of repute is in reality lodging in some cheap lodging house along Park row or the Bowery.

A New Yorker who spent much time recently studying the members of the happy family, discovered that they numbered a lawyer, a physician, an inventor, a patent solicitor and an old commercial traveler. The whole group were traveling as the saying goes, on their uppers, but they wouldn't admit it.

How they manage to exist is a mystery, and probably they would all quickly drift to the workhouse did not the polite notes that some of them send to the friends of their better days produce something substantial in the way of financial assistance. They term these gifts "loans," but the loans are never repaid. As long as the money holds out, they have a jolly, happy-go-lucky time of it at the saloon.

Sometimes one of the Micawbers will pull himself together and disappear for weeks at a time. Such disappearances are a sure sign that something in the way of work has turned up at last. But it is transitory employment, and the Micawber always returns to his old haunt, happy once more in the

eccentric society of his impecunious fellows.

The proprietor of the hostelry said that it cost him nearly \$2,000 a year to feed the coterie. He has got all their whimsicalities down to a fine point and knows all their stories by heart, but he seems to have a compassionate spot in his heart for them, and often when business is dull toward the approach of midnight he will fill up a lot of generous bumpers of hot stuff for them, and after they have tossed it off they will sing a glee for him in rollicking chorus. Sometimes he gets nettled at them, and shuts both them and the resort up abruptly.

It is an odd phase of the varied life of the big metropolis, and it has pathos as well as interest, and the moral that makes it worth studying is one that men of wit and talent who are apt to be too fond of an easy time can take to heart with profit. When you are able to earn money by your talent, lay by some of it for a rainy day, and don't find yourself forced into membership in the coterie of Has Beens, the Micawbers of Gotham.—*New York Sun*.

#### War's New Terrors.

Indications are that when two European armies eventually meet on the field, if the war talk ever resolves itself into actual conflict, a good many men will faint away in terror of their adversaries, says the *New York Sun*. The "inventions" which have been brought out lately in France, Germany and Austria, and which have been purchased by the governments of these countries, are innumerable, and every one of them is designed to slaughter human life at a rate that appals the imagination. The most intense and theatric secrecy is maintained concerning all these inventions and only a few general facts regarding them have been made public. The German army, it is understood, is armed with rifles which will send a bullet through four men, standing one behind the other, at a distance of two and a half miles from the rifle. Austria has a machine gun which shoots several thousand bullets a minute, which is operated by steam and controlled by a single gentleman with a waxed moustache and a monocle in his left eye, who lightly turns the crank. At least this is the condition of things according to the latest illustrated journals at hand. The man with the eyeglass can turn the crank fast enough to sweep thirty or forty thousand men into eternity during the luncheon hour.

Incidentally a German tailor has invented a coat that makes the wearer absolutely indifferent to bullets at any range, and the Italians have a machine for throwing very small and almost invisible torpedos a distance of nearly a quarter of a mile. The

torpedos describe a parabola in the air, drop into the camp of the enemy and explode with force enough to kill a hundred or more soldiers, if they happen to be in the vicinity. Great numbers of them can be thrown at a time, and a pleasing and cheerful feature of it is that there are no disagreeable odors nor any smoke whatever when the explosion occurs.

M. Turpin of France is the latest hero in this direction. He has invented something which is so altogether awful that the taxpayers have requested the government to give M. Turpin a great amount of money so that he will not turn his machine over to the Germans. This machine is operated by electricity, and, according to its inventor, it is of so terrible a nature that it will do away with all fortifications throughout the civilized world. This is merely a detail of the execution which this machine is expected to accomplish. Forts will be of no use, because M. Turpin's machines would rend them into atoms, and at a distance of several miles a man can mow down the enemy at the rate of 20,000 at an engagement. The facts are inspiring, but there is a lack of detail about them which is in accordance with much of the literature which has lately been put forth by the various Munchausens among the war officers of Europe. The Turpin invention so far outstrips everything else, according to the critics of modern warfare, that it will insure universal peace. One machine alone is enough to devastate a country.

#### He Shut Him Up.

"Does this razor cause you any unnecessary pain?" asked the barber.

"No," replied the victim; "by holding my breath and clinching my teeth I think I shall be able to endure it without taking any more gas."

Silence reigned thereafter.—*Arkansas Traveler*.

#### A New Song.

"And this is your birthday gift from your husband?"

"Yes but I have never taken a piano lesson."

"Can't your husband teach you? I heard some one say that he played the races beautifully."—*Chicago Inter-Ocean*.

#### Make the Surroundings Natural.

Dealer—This is the best parrot we have, but I wouldn't sell him without letting you know his one fault—he'll grumble terribly if his food doesn't suit him.

Miss Fitz—I'll take him. It will seem quite like having a man in the house.—*Spare Moments*.

### Knew He Was Color Blind.

He had marks of ancient paint about his garments. There was an anxious, uncertain look on his face as he inquired of the motive power clerk if Mr. Thompson was in. "No," replied the clerk, "but there he is, coming along the hall."

The marked man walked along to meet the superintendent of motive power, and cheerfully exclaimed, "Good morning, Mr. Thompson!"

"Good morning," was the reply, "but you have the advantage of me."

"Why, Mr. Thompson, don't you remember me. I'm Tom Grimshaw. I worked for you ten years ago."

"What do you want now?"

"I want a job painting."

"I don't believe you are capable of mixing paint properly. You would be sure to spoil lots of material."

"Why, Mr. Thompson," answered the son of the brush, "you know I was a good hand when I worked for you before, and never spoiled any material."

"I can't help that; but all the same I know that you are color-blind. Last time I saw you, you told me that I was an old white headed son-of-a-gun, and I had not a white hair in my head at that time."—*Locomotive Engineering*.

### Oure for "Freshness."

We spent a half day in a roundhouse lately and observed a few things. For instance:

One fireman was explaining to another how the injector worked—and a very good explanation it was.

The engineer was packing, and, seeing a stranger with a boiled shirt on interested in the explanation, put in his oar: he first reminded the firemen that he was "runnin' when they was born," and then commenced to explain the injector for our especial benefit—the old vacuum-in-the-feed-pipe explanation.

The whole proceeding was comical in the extreme, and reminded us of the section foreman's rebuke:

"Putt doon that ile can, Jerry Cassaday and kape away from that push-kayr. Go git youre tchuvel, there do be oulder min on the job than youse—phwat the divvel do ye know about matchinnery, anyway?"—*Locomotive Engineering*.

### A Form of Belligerency.

"I never saw such a fellow as Banx," remarked a man about town. "He is always challenging some one to play poker."

"Yes. He goes about, so to speak, with a stack of chips on his shoulder."—*Washington Star*.

### No Time to Aim.

It is a strange fact that the human hand, eye and nerve are so constituted as to act automatically and correctly at the proper moment, almost without conscious effort on the owner's part. The author of "Tales of a Nomad" gives an experience that illustrates this in a most fortunate manner.

"We were passing through grass about two feet in height, with clumps of low scrub here and there. I was leading, and my spoorer, a Kafir named Jacha, was following me. He had only one eye, and that eye was keener to detect game than two pairs of ordinary optics; but on this occasion it overlooked a terrible danger, for the reason that the danger, though within a few yards of us, was invisible.

"There was a rustle in a patch of scrub six or seven yards before me, and suddenly out of it rose a wounded buffalo with bloody mouth and glaring eye, wheeled round facing me in act to charge.

"It all took place quicker than thought. My rifle, which, happily, was at full cock, went up to my shoulder instinctively and I dropped him in his tracks with a ball through the brain.

"So sudden was the whole affair that my heart had not even time to give a great thump. I do not quite remember how I did it. I am sure I did not take a fine sight and I doubt whether I looked at the rib of my rifle at all."

### Black Hosiery is Doomed.

In Paris the cry has gone up: "No more black stockings," and the shops in Paris are eager to please, and, obedient to the voices of their fashionable customers, exhibit now heaps of silk and thread hosiery, all of the same color, but infinitely varied in shades, from the dark gray called steel gray to the palest dove tint. A few white articles are seen in the lot, and far away, in a remote corner, a thousand pairs of black silk stockings, open-worked, as thin as the webs of the most artistic spider, lovely, but disdained and snubbed by their friends of old, are given away almost for nothing.

### Compensation.

The devoted wife seemed not at all disconcerted, although his anguish was plainly poignant.

"Certainly," she answered. "I had just as lief sell my diamonds and wear paste once as not. Of course!"

For the first time a shade of anxiety swept across her face.

"I will still have a detective to follow me about when I wear them."

Yes, indeed; that would be arranged.—*Detroit Tribune*.

## Discover an Elotherium.

Prof. J. B. Hatcher and his party of students from Princeton college, who have just completed a tour through the Bad Lands of South Dakota in search of fossils and petrifications, have met with very great success. The party has been in the Bad Lands between Cheyenne and White river since the first of March. Since completing their task the students have started on an overland trip to Yellowstone park. The collection of fossils has been shipped to Princeton. It weighs 9,000 pounds and consists of rare specimens of extinct animals.

The choicest and most valuable specimen was the elotherium, or extinct pig. The specimen was found protruding from a bank of one of the deep hollows in the Bad Lands. This is the only skeleton ever found of this character in that district, and was perfect, no bones being missing. This carcass is much larger than the modern pig, in fact it is larger than the living rhinoceros. Another specimen was the titanotherium, or extinct rhinoceros, which was twice as large as the modern rhinoceros. He also found several specimens of the rhinoceros family, and the metamyndor, a relative of the rhinoceros. A fine specimen of the poebrotherium, a species of the camel, is among the collection. This animal was very much smaller than the modern camel. Then there are skeletons of numerous small animals. He found a few fish skeletons, the only fish skeletons ever found in these beds. Last year's expedition from Princeton succeeded in obtaining the only crocodile ever found in the Bad Lands. On this trip a good specimen of the amphisbaenoid lizard was unearthed, the only specimen of this reptile, so far as known, ever found in the world. This has no limbs at all and was a very low order of lizard.—*Chicago Record.*

## This Way in El Paso.

A good story illustrating one phase of the silver question was told by Lawyer Solomon Lincoln at the Boston Merchants' club, of which he is a member.

"People living on the border between Mexico and the United States ought to be pretty well satisfied with the present condition of affairs," said he, "with things as they are in the vicinity of El Paso, Tex.

"El Paso is located on the Rio Grande. If you cross the river you are in Mexico. In El Paso an American silver dollar is worth 100 cents, but if you go over into Mexico it is only worth 85 cents.

"A Mexican silver dollar, on the other hand, is subject to a discount of 15 per cent. in El Paso. So that there is retaliation, you see.

"When a citizen of El Paso is thirsty he steps into a barroom in his town and orders

a lemonade or something stronger and planks down an American silver dollar on the counter.

"The drink is placed on the counter.

"After the customer has quenched his thirst he picks up his change.

"This does not consist of 85 American cents. Oh no! The price of the drink was 15 cents, but the change consists of a Mexican silver dollar, worth but 85 cents.

"Later in the day the citizen of El Paso crosses the river and pays a visit to the Mexican town on business or pleasure.

"He becomes thirsty again.

"Entering a Mexican barroom he steps up to the counter and says:

"'Whisky.'

"The drink is placed on the bar and after draining the glass the El Paso man settles. This time he pays for his drinks with a Mexican silver dollar.

"The Mexican bartender smiles deprecatingly as he gives his customer his change—an American silver dollar, worth, of course, but 85 cents.

"Then the American crosses over to El Paso again. He can go home and spend the night with his family or he can buy another drink in his own town and get another Mexican silver dollar.

"He can go back and forth all day, you see, get all he wants to drink and still have a silver dollar in his pocket.

"It may be an American or it may be a Mexican silver dollar, it makes no difference to him.

"Is it any wonder that the people of El Paso are satisfied with the present status of the silver question?"—*New York Advertiser.*

## Good as a Guide Book.

People who have traveled are apt to think that their conversation should consist largely of descriptions of the different places they have visited. Mr. Horatio Barnes and his friend, Mr. Smith, had passed a year in Europe, and had not been at home very long before Mrs. Barnes began to look upon Mr. Smith's frequent visits at the house as a kind of infliction. No sooner were the two men seated than they began to descant upon the glories of Paris or the beauties of some other foreign city. Mrs. Barnes had never been abroad, but she was a woman who had read widely and could converse acceptably, and she decided that for the present she had heard enough about her husband's travels.

"No doubt you enjoyed Cordova?" she remarked one evening when the gentlemen had reached Spain in the course of their "fireside travels."

"Oh, certainly, Mrs. Barnes. Small place, but interesting," answered Smith, briskly.

"The scenery there must have delighted you, and if you visited any of the homes of

the nobility you were doubtless impressed by the number of beautiful paintings on their walls. Why, in one salon in Cordova there are pictures by Alonzo Cano, Murillo, Corot, Landelle and Bouguereau."

"Yes," responded Mr. Smith. "Well, I don't seem to recall much about the town only the trouble we had in getting there."

"I suppose you liked Madrid better?" remarked Mrs. Barnes.

"Yes; Madrid, as you know, is a famous city."

"Certainly. You doubtless remember Pradilla's wonderful painting of Queen Juana, which is owned by the city?"

"No," replied Mr. Smith briefly. And he looked at Mrs. Barnes in undisguised astonishment as she continued to praise or criticise the attractions of foreign cities, asking Mr. Barnes his opinion of the several modes of travel between places of interest, and speaking familiarly of different continental hotels.

Mr. Smith finally endeavored to change the subject, but Mrs. Barnes insisted on pointing out to the two gentlemen how little they had really seen, explaining carefully the wonderful paintings they had left unvisited. At last, at a somewhat later hour than usual, Mr. Smith took his departure, with an inward vow never to introduce the subject of foreign travel again.

"When were you abroad, my dear?" Mr. Barnes asked as soon as his friend had disappeared.

"Never," was the smiling reply, "but we have several guide books in the house and I decided that as you and Mr. Smith preferred to talk out of them I would talk too. I have read them very carefully, and I presume many of your friends have enjoyed the same privilege."

"I hope not," said Mr. Barnes, but the ingenious reproach had the desired result.—*Youth's Companion*.

### How China Got Its Name.

Upwards of 1,100 years before Christ the Chinese were a people ruled by a dynasty of kings, but there is no authentic history of them prior to the Chow dynasty. The "Celestial empire" has in its time borne many odd names, for it was formerly the custom to change the name of the country every time a new dynasty gained control of governmental affairs. Thus in the ancient writings we find it referred to as Hai-que, Cham-que, Han-que, etc., according to the name of the ruling monarch. The true name, according to oriental scholars, is Chum-que, which means "the center kingdom of the world." The early European explorers, especially the Portuguese, corrupted Chum-que into Chin que, and from this word later navigators evolved the word China.—*St. Louis Republic*.

### Maine Birds in July.

Our Maine July, even when hot, is musical. The robin and catbird have not yet tired of domestic occupations; they are both busy rearing their second broods. worms are plenty and they are loud in expressions of paternal interest—satisfaction or apprehension, as the case may be. Those who venture near their nests get roundly scolded and perhaps even threatened with more serious treatment unless they move off. A friend of ours who confesses to having played upon the apprehensive natures of a pair of catbirds that yearly built near his house, says he has not always been sure of the safety of his own eyes, so swiftly did the worried parents dart about his head. Left quietly alone, however, they fill much of the day with exultant songs, croonings, lullabys and the mild chatter of their small talk. The song sparrow keeps on with his gentle raptures; you often see him perched upon a low limb or a fence rail at midday, even, pouring out his little song, so full of simple sweetness and the pure joy of existence. And this he keeps up all summer, being one of the few birds that does not give up his song even in August. The whistle of the quail, too, may be heard often at noon on the hottest day; he is weather-proof along with the towhee or chewink and swallows, whose twitterings do not cease except at night. Among the thickets which line the country roads your eye sooner or later will catch a gleam of rufous color, as that prince of songsters, the brown thrasher, looks out at you from his retreat. If not too near the mid-day heat—surely if you call upon him early in the morning—he may be depended upon to delight your ear from a low tree top with a flood of such masterly melody as you will hardly hear elsewhere.—*Lewiston Journal*.

### Do Animals Think?

Mrs. Mouseawary had a great many children. At the time of which I write no less than six were living on the same farm with her, and all of them were black, like herself. They were so large then that she had ceased to treat them as kittens; indeed, they were quite as big as she was, but they had not forgotten that she was their mother, and would not allow her to be insulted with impunity.

This is how it happened. One day Mrs. Mouseawary had a choice bit of meat which she was eating with relish when she was espied by Sport, an American setter. Generally the dogs and cats on the farm lived at peace with one another, and when two or three cats were together Sport, being somewhat of a coward, was especially careful not to give them a chance to use their claws on him. But he was also, I regret to

say, somewhat of a sneak, and now, perceiving that pussy was alone and unprotected, he did not hesitate to charge upon her and procure the dainty for himself.

What did Mrs. Mouseawary do? She was not strong enough to assert her rights by herself, but she went straight to those six black kittens of hers and told them all about it. Cat language evidently admits of explaining a case very clearly, for pussy was not only able to tell her children how she had been wronged but also to point out to them just which of the white dogs it was that stole her lunch.

The dogs went to their kennels to be fed every evening at 6, and Sport was in the habit of repairing thither about fifteen minutes before that time. To reach his kennel it was necessary that he should pass through a gate beside which grew a pine tree. The cats had evidently observed all this, for a little while before the accustomed time for Mr. Sport's advent they climbed up the pine tree and hid themselves among the branches at a convenient height from the ground and lay in wait.

It was not long before the culprit came along as usual, little dreaming of the punishment in store for him. As he passed under the tree the cats with one accord jumped to the ground and surrounded him, and so terrific was their onslaught that their victim found it impossible to escape and could only crouch to the ground and yelp for mercy.

It was well for Sport that the gardener came running to his assistance, otherwise such a terrible use did his six black enemies make use of their claws that he would have had no eyes and very little hair left to boast of.—*F. A. D. in Chicago Times.*

### Fresh From the Strip.

A bright young woman who went into the Cherokee strip on the day of the opening last September, is Miss Suda Bates, and she knows a great deal about the new territory. She entered Red Rock on the afternoon of Sept. 16, and the next morning rode thirty miles on horseback to the new town of Perry. She did not take up a claim at once, but was immediately installed as assistant postmaster. A few weeks after she undertook the management of the *Oklahoma Herald*, a weekly paper. She wrote all the reading matter in the paper, tended to the advertising, swept the office, and bossed the foreman, enjoying life very much meanwhile.

Perry, which started in on its career as a city with 20,000 inhabitants on the first day of its existence, is now reduced to 7,000, but Miss Bates thinks this population will be steady and that if the people can live till their crops come in they will be all right. Over 95 per cent. of the residents of

the strip own their homes; 40,000 farms have been taken up. Miss Bates has ridden all over the country on horseback. She says it makes her angry to see how much better the government treats the Indians than it does the settlers. Seed and machinery are furnished the wards of the nation, a man sent to teach them farming whenever they desire it, and a house built for them. They prefer to live in their teepees, however, and stable their horses in Uncle Sam's houses. At the door of the wigwams the braves sit and smoke, while the squaws do all the farming. Shortly before she left Perry an Indian with whom she had become friendly invited her out to a ghost dance at Chief Whitewater's farm. The dance began Sunday afternoon. The Indians, in their best finery, took hold of hands and danced in a ring. This is simply the Indian method of "getting religion." They keep up the dancing till one of the dancers faints, when he or she is laid inside the ring and left to regain consciousness. The religion comes when they faint, and they are supposed afterward to have been "converted" at the time.

### High Train Speeds.

The popular appreciation of high train speed is altogether comparative. For a few years past there has been an ambition among some railroad men to have a clear record of 100 miles an hour. Although there is no authentic record of that speed having been reached, the nearest possible approach to it is used as the subject of boasting, and stretching the figures in the five score direction is the most innocent and popular subject of lying.

The reckless destruction of truth over train speed has hitherto been confined almost exclusively to this continent and to the British Isles. We are pained to notice that this infection of pride and mendacity is spreading. The Dutch are agitating to have the express trains speeded up away above the velocity of their canal boats, and even sleepy Spain has wakened up, and trains with schedules based on the ox-cart pace are no longer popular. The agitation in favor of higher train speeds in Spain has not been barren of results, for the papers have lately been full of sensational accounts of a train that for two hours kept up a speed of twenty-five miles an hour. We are afraid that some of the newspaper reporters from Buffalo have gone to Spain—the fellows who made out that a certain train was running at the rate 112 miles an hour.—*Locomotive Engineering.*

Ada—"I've been wondering all day why you weren't invited to the Bigelows."

Kitty (sweetly)—"And I've been wondering why you were."—*Life.*

**LOVE FIXED HIM.**

"Love hath made me rich," he said;  
 "I was poor and lone;  
 Life, to me, seemed hopeless—dead!  
 Bitter was my moan.

"Like a beggar at love's gate,  
 There a crust to win,  
 Love came in the twilight late,  
 Kissed and led me in.

"Now my servants come and go,  
 All the neighbors stare,  
 (This love's father-in-law, you know  
 Is a millionaire!")

—*Atlanta Constitution.*

**Indian Relics after a Flood.**

A few days ago when the water in the Allegheny river was slowly subsiding, a man was noticed walking along the shore intently scanning the banks. "I am hunting for Indian relics," he said.

"You see, in the early days this was a great redskin country. Thousands of Indians followed the rivers in their canoes and lived along the banks. Every time the water is high I am sure to find some trophy that a savage no doubt prized highly. The flood carries them down and deposits them along the shore, or they are washed out of the banks.

"Many a time after a rise I have discovered a stone tomahawk or a battle ax sticking out of the mud that had been lost years ago, and the water had revealed it. I have at my home a lot of Indian relics, including arrowheads, tomahawks, battle-axes, pieces of baked pottery, and other interesting articles. Most of them I have found along the rivers immediately after high water. I remember during the flood of 1889 I unearthed a double bitted battle-ax. It was the first of the kind I had ever seen. Before the advent of the white man the Indians knew nothing of metals. Their weapons were made chiefly of stone.

"As a rule, the tomahawks are not works of art. A thin stone was chipped off to make it as sharp as possible, and sometimes the Indians serrated the edges to make them more effective in dealing an enemy a blow. The jagged appearance of many of the tomahawks I have collected shows that the savages knew how to inflict pain upon an adversary.

"The tomahawks either had no handle or very short ones. They were tied to clubs by thongs, which the Indians wielded with unerring aim. The boys were taught to throw them, and every brave was an expert at it.

"The double-bitted battle-ax in my possession has a short handle. There is evidence to show that it had been tied to a club like the others. Occasionally a tomahawk is unearthed that some redskin had taken the trouble to polish, or at least make it smooth. This was done by rubbing stone against stone. The chances are that these

hatchets were carried by the chiefs. With these stone implements the Indians cut down great trees and young saplings. As a rule, however, when they wanted timber they burned the trees at the base and then hacked at them until they fell.

"Some years ago I found a curious article along the Allegheny that has puzzled me to figure out what it was used for. It is wedge-shaped, not very large, and has a hole worn through it at the end. It is large enough to admit the hand, and places were made on the side for the fingers and thumb. I find that my hand will fit the position exactly, which leads me to think that it was used by women. I reason that the hand of the average Indian was larger than the white man's."—*Cor. Pittsburgh Chronicle.*

**Why Fish Bite at Flies.**

Sir Herbert Maxwell's recent argument is to the effect that salmon bite at the fly from curiosity, or from mixed motives, not from hunger. A second rise may be "motivated" by wrath at a slight prick. This we think unreasonable. The more a fish—a salmon, that is—feels a prick the less chance there is of his coming again. The angler may be sensible of a tug and yet may hook his prey on a second venture, but then it is probable that the salmon never touched the point. He got hold of the feather or of the body of the hook.

The hypothesis of his indignation was invented years ago, in the case of trout, by the *Spectator*. Some one argued that trout do not feel as we feel, consequently that angling is not so cruel as angling for the editor of the *Spectator* would be. That position is demonstrable. The mouth of the editor of that humane journal is not a grisly, horny kind of substance. The theorist went on to urge that you may see a trout feeding in clear water, may put a dry fly over him, hook him, lose him, see him feed again, hook him again, lose him and never put him off his feed. This is a matter of fact. Last summer we had occasion to observe it. The trout, twice hooked, never ceased to feed; he only shifted his position by about a foot and a half, and went on eating natural flies. Now, this circumstance shows that the trout's appetite was undiminished, though he had twice felt the steel and been dragged across the stream.

The *Spectator*, however, urged that the pricked fish comes again, when he does come again, in anger and revenge. Nonsense! He merely continues to dine, taking such floating flies as recommend themselves to his taste and fancy. Now, if you hooked the *Spectator* with a white bait and played him up-stairs and down-stairs, and stirred him up under the table and broke him on the banister he would not proceed to a culet.

The trout does not remain feeding nor

mally, sometimes. The argument that he snaps in anger may therefore be dismissed. The fish's motive is appetite. He is looking for floating flies and he sometimes takes the artificial for the real article. If hooked he often does not feel pain enough to frighten him.—*Saturday Review*.

### "High Man Out."

Three buds of promise in summer gowns came fluttering into a west side drug store and went to the soda water fountain as if by instinct.

"Will you let us have the directory, please," said one of them.

The bulky volume was laid before her.

"Now, girls, remember. The last figure counts, right hand page and each one gets three cuts. I'll begin."

She opened the book and said "Oh-h-h," while the two giggled with delight. The page was 1703.

"Put down 3 there," said she. Another cut brought 467.

"That makes 10. Now I get another. Good! That's 5 more. Fifteen isn't bad."

The second girl opened at 269, so that 9 was her first count. Next time she "cut" 3 and the last number was 7, making her, as she observed, "high man."

The third began with 76, added 5 and collapsed on the third trial, for the right hand page was 1451.

"I'm stuck," she said with the philosophic air of a thorough sport. She began to rumage in her purse, and the highly entertained drug clerk drew three chocolate ice creams.

He observed after the girls departed: "That's the first time I ever knew the city directory was a gambling implement."—*Chicago Record*.

### Birds as Foragers.

Food provision is the object for which birds periodically change their dwelling places. The sovereigns, the bishops, the barons of the old and mediæval times, when they had exhausted the resources of one estate moved on to another. This was the reason of the constant journeyings of our ancestors in the days gone by, when each district provided for its own needs. The fashion among birds still prevails. Hence the great waves of bird life constantly ebbing and flowing high up in the ocean of air; hence the regular migrations so wonderful in the distances and dangers little birds compass in their long flights over thousands of miles; hence the fitful flittings which, on a smaller scale, distinguish even the birds that are classified as stationary species.

There is no food at all left for the birds in the higher arctic regions in winter; plants, fish, insects are killed or buried in the ice and snow; the vast hordes of lemmings, lit-

tle creatures near akin to the voles that have made such ravages on the sheep farms of southern Scotland of late years, leave high latitudes; there is nothing left even for birds of prey.

In the summer, wild luxuriance of forest, field and fen, shoals of fish in the great rivers and the deep blue sea, swarms of insects flying in dense clouds over field and fjord and steppe and birds in teeming multitudes—sea birds, river birds, sand birds, hill-loving birds, wood-haunting birds, field birds, birds big and birds little, myraid hosts of birds. In the winter, frozen seas, ice-bound rivers, iron hills, snow-clad forests, snowy fields, no fish, no insects, no seeds, no berries, no worms visible even to sharp bird eyes, therefore, no birds.

In the countries bordering on the polar seas, where the changing seasons bring alternately the two extremes of dearth and plenty, birds are more numerous in the short summer than anywhere else all the world over and in winter absent altogether. All are migrants there by force of circumstances.—*Cornhill Magazine*.

### Used to It.

Young Author (engaging apartments)—"You have several literary men boarding here, I believe."

Mrs. Slimdiet—"Yes, quite a number. I like literary men."

"I am delighted to hear it."

"Yes, you see, literary men never kick when I demand cash in advance. They are used to it."—*Spare Moments*.

### The "Scorching" Position.

"Can't you give me a motto as a sort of guide while I'm struggling through my career?" said the young bicyclist who had determined to become the greatest racer of his age.

"Certainly," said the sporting man, thoughtfully. "Hump yourself."—*Chicago Record*.

### Had to Do It.

She—"Why, there's Charley Van Beet. Don't you remember his going to California with his fiancée?"

He—"I should say I did. He wrote me he didn't have money enough to get back. How do you suppose he managed it?"

She—"Why, he married her out there."—*Life*.

### It Suited Him.

Nodd—"My father-in-law and I have bought a horse and carriage together.

Todd—"How do you manage about dividing up the expenses?"

Nodd—"Easy enough. He keeps the horse and I keep the carriage."—*New York World*.

### Public Works for the Needy.

The fact that the best system of charity is the employment of the needy rather than the distribution of relief to those who remain in idleness, whether enforced or otherwise, has been proven conclusively, I believe, during the past winter by the operations of the citizens' employment and relief committee in Pittsburgh. I was a member of the committee, and was very familiar with its workings. Over a quarter of a million dollars, or, in round numbers, \$253,000, were expended under the direction of the committee during the winter on the improvement of Schenley and Highland parks. The wages paid were \$1 per day, and over 13,000 men were employed during the course of the work, upon whom nearly 50,000 other people were dependent. There were over 22,000 applications received from men who desired work, and the system followed in the consideration of these requests was simple but effective. Each applicant's condition was investigated to see whether he needed relief and was a resident of the city. This latter point prevented the idle and unemployed from the outside from coming in. The applications were handed to the police authorities, and the policemen inquired whether the applicants were deserving or not, and so reported.

In this way we effectually prevented the unworthy and imposters from receiving help. There was such a large number of applicants, and it was so necessary to give every man a show, that there were frequent discharges. For instance, a man would work two or three weeks and then be laid off to give another deserving applicant a chance. The men thus laid off were re-employed when the opportunity arose, but when a man was discharged for cause he was not allowed to get work again. I believe that organized charity in all the great cities should be carried out upon such lines. There are hundreds upon hundreds of the deserving needy who would starve or even steal before they would beg. I know that is a broad statement, and the latter part of it indicates a good deal of innate immorality on the part of humanity, but the fact still remains that a great many people will commit crime before they will beg, while the instances of starvation from motives of pride under such circumstances are too numerous to need mention. Both of these classes, however would eagerly take advantage of honorable work by which they could secure the necessities of life. It is a question that should be deeply considered by those philanthropic citizens upon whose joint efforts communities depend for the relief of their unfortunates in the time of need. It makes no difference whether a relief fund is the result of popular subscription or of state, municipal or national

appropriation. All persons in need of its help, and who are able to perform manual or other labor, should be accorded an opportunity to give some return for the assistance which they receive. Such a system takes the sharp sting out of charity for those who dislike to receive it under that name.—*R. A. Corlaish in Washington Star.*

### Wyoming Soda Lakes.

As described by H. Pemberton, Jr., and George P. Tucker, there exists a deposit of sulphate of soda locally known as a "lake," about fourteen miles southwest of Laramie, Wyo. The deposit is composed of three of these lakes lying within a stone's throw of one another—the Big lake, the Track lake, and the Red lake—having together a total area of about sixty-five acres. They are the property of the Union Pacific Railroad company, and are connected by a branch of that road with the main line at Laramie, and are generally known as the Union Pacific lakes. In these lakes the sulphate of soda occurs in two bodies or layers. The lower part, constituting the great bulk of the deposit, is a mass of crystals of a faint greenish color, mixed with a considerable amount of black, slimy mud. It is known as the "solid soda," and is said to have a depth of some twenty or thirty feet. Above this solid soda occurs the superficial layer of pure white crystallized sulphate of soda. This is formed by solution in water of the upper part of the lower body, the crystals being deposited by evaporation or by cooling or by the two combined. A little rain in the spring and autumn furnishes this water, besides innumerable small, sluggish-flowing streams are present in all the lakes; but on account of the dry air of this region the surface is generally dry, or nearly so, and in midsummer the clouds of efflorescent sulphate that are whirled up by the ever blowing winds of Wyoming can be seen for miles. The layer of white sulphate is from three to twelve inches in thickness. When the crystals are removed the part laid bare is soon replenished by a new crop.—*Popular Science Monthly.*

Blinkers—"This life insurance idea is good enough if a man dies young, but suppose I should live thirty or forty years longer—I'd be terribly out of pocket."

Agent—"No danger of that, sir. You'll soon kill yourself working to pay the premiums."—*New York Weekly.*

"Of course you believe in the millennium," said the irritable man's friend.

"To be sure."

"What is your idea of it?"

"It'll be a time when every lawn mower will have a music box attachment."—*Washington Star.*

## GRAND LODGE.

**Assessment Notice for August.**

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., August 1, 1894. )  
ASSESSMENT No. 47, \$2.00.

**To Receivers of Subordinate Lodges:**

SIRS AND BROTHERS:—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz.:

CLAIM No. 1292. Amos G. Carpenter, of Liberty Lodge, No. 242, died of Heart Disease, February 25, 1894.

CLAIM No. 1293. Owen Edwards, of Silver Mountain Lodge, No. 327, died of General Paralysis, March 4, 1894.

CLAIM No. 1294. Fred W. Lusso, of Blue Mountain Lodge, No. 348, Scalded to Death, March 14, 1894.

CLAIM No. 1295. Charles Fullington, of Red River Lodge, No. 8, was declared totally disabled by Scalds and Injury to Skull, April 27, 1894.

CLAIM No. 1296. Samuel J. Cushing, of Fellowship Lodge, No. 121, died of Typhoid Fever, May 3, 1894.

CLAIM No. 1297. Matthew E. Gratz, of Alpha Lodge, No. 26, was Drowned, May 6, 1894.

CLAIM No. 1298. Samuel T. Williams, of Hinton Lodge, No. 236, was declared totally disabled by Disease of the Lungs, May 8, 1894.

CLAIM No. 1299. John C. Pier, of Phil H. Sheridan Lodge, No. 348, was declared totally disabled by injury to Right Leg, May 14, 1894.

CLAIM No. 1300. G. M. Porter, of Loyal Lodge, No. 37, died of injuries received in a Wreck, January 16, 1894.

CLAIM No. 1301. Samuel A. Ertel, of O. K. Lodge, No. 269, was Run Over and killed, February 6, 1894.

CLAIM No. 1302. William McCosh, of Vandalia Lodge, No. 405, was declared totally disabled by Insanity, March 28, 1894.

CLAIM No. 1303. Emmet Tarrant, of Spanish Peaks Lodge, No. 328, died of Blood Poisoning, April 5, 1894.

CLAIM No. 1304. Aubrey Tubbs, of White Breast Lodge, No. 278, died of Tubercular Phthisis and Dropsy of the Heart, April 12, 1894.

CLAIM No. 1305. John H. Adams, of Macon Lodge, No. 246, died of Compound Fracture of the Skull, April 15, 1894.

CLAIM No. 1306. Michael Leaven, of O. K. Lodge No. 269, was declared totally disabled by Curvature of Spine, April 17, 1894.

CLAIM No. 1307. Con. O'Connell, of Gate City Lodge No. 93, died of Tubercular Laryngitis, April 19, 1894.

CLAIM No. 1308. B. P. Guion, of Peace Lodge No. 109, died of Gunshot Wounds, April 24, 1894.

CLAIM No. 1309. H. W. Fowler, of Elm City Lodge No. 284, was declared totally disabled by Spinal Concussion, April 24, 1894.

CLAIM No. 1310. Hugh McGinley, of Santa Rosa Lodge No. 308, died of Smallpox, April 25, 1894.

CLAIM No. 1311. A. D. Isom, of Evening Star Lodge No. 112, was declared totally disabled by Loss of Arm, May 15, 1894.

CLAIM No. 1312. M. L. Hann, of Red River Lodge No. 8, was declared totally disabled by Injury to Spine, May 4, 1894.

CLAIM No. 1313. Joseph Beckerton, of Morning Star Lodge No. 88, died from Valvular Disease of the Heart, May 6, 1894.

CLAIM No. 1314. Charles B. Martin, of Fidelity Lodge No. 185, was declared totally disabled by Loss of Leg, May 7, 1894.

CLAIM No. 1315. A. M. Sourwine, of Connecting Link Lodge No. 25, died of Heart Failure, May 10, 1894.

CLAIM No. 1316. Thomas A. Silva, of Just in Time Lodge No. 149, died of Endocarditis, May 12, 1894.

CLAIM No. 1317. John E. Glasson, of Marvin Hughitt Lodge No. 132, died of Heart Failure, May 19, 1894.

CLAIM No. 1318. G. W. May, of Alamo Lodge, No. 263, died of Injuries received in a Wreck, May 23, 1894.

CLAIM No. 1319. John H. Elliott, of Magnolia Lodge, No. 226, killed in a Wreck, May 25, 1894.

CLAIM No. 1320. Edward Davis, of Three Branch Lodge, No. 304, was declared totally disabled by Insipient Tuberculosis of Lungs, May 28, 1894.

CLAIM No. 1321. G. W. Seybert, of Tip Top Lodge, No. 396, was declared totally disabled by total and permanent Anchylosis of right wrist, May 28, 1894.

CLAIM No. 1322. Jacob A. Gaither, of Magnolia Lodge, No. 226, killed by Engine Turning Over, June 2, 1894.

CLAIM No. 1323. Robert B. Collins, of John A. Logan Lodge, No. 470, killed in a Wreck, June 4, 1894.

CLAIM No. 1324. John Patrick, of A. G. Porter Lodge, No. 141, was declared totally disabled by Atrophy of Left Leg, June 5, 1894.

CLAIM No. 1325. William E. Ranek, of Fairmount Lodge, No. 335, died of Cerebral Syphilis, June 8, 1894.

CLAIM No. 1326. S. A. Poulton, of Vandalia Lodge, No. 405, was killed in a Wreck, June 9, 1894.

CLAIM No. 1327. William H. Steele, of Riverside Lodge, No. 197, was declared totally disabled by General Nervous Prostration, June 18, 1894.

An assessment of TWO DOLLARS (\$2.00) has been levied for the payment of the above claims, and you are required to forward said amount for each member whose name appears on the rolls of membership AUGUST 1st, 1894 (also for all members having taken a withdrawal (limited or final) after AUGUST 1st, and for all members who died or were totally disabled since that date), said remittance to reach the Grand Lodge not later than AUGUST 20th, 1894, as provided by Section 50 of the Constitution. Any lodge failing to make returns as above provided will stand suspended from all the benefits of the order, as per Section 52 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## Beneficiary Statement.

OFFICE OF GRAND SECRETARY AND TREASURER, )  
TERRE HAUTE, IND., July 1, 1894. )

To Subordinate Lodges:

SIRS AND BROTHERS:—The following is a statement of the Beneficiary Fund for the month of June, 1894:

 1324, 1325, 1326, 1327 . . . . . \$42,000 00

Balance on hand July 1, 1894 . . . . . \$46,477 75  
 Respectfully submitted,

F. W. ARNOLD, G. S. and T.

## Special Notice.

No lodge should be without a copy of the latest book of schedules of wages and agreements between Engineers and Firemen and Railway Officials. We have a large supply on hand and will furnish them to subordinate lodges at seventy five cents per copy. Send your orders at once and they will be promptly filled. All orders must come through the Secretary or Acting Secretary of the lodge.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. and T.

## NATIONAL HOTEL.

Brother J. H. Brewer, Proprietor of National Hotel, Hot Springs, Arkansas, and member of B. of L. E. Division 182, has been advertising in the MAGAZINE for some three years, and asks us to again remind our readers that he is looking for railroad men to stop with him whenever passing his way. We hope the boys will give this brother the preference every time when they have occasion to visit Hot Springs.

## He Doesn't Keep Late Hours Now.

The Husband (late from the club)—I er—didn't suspect you would be sitting up for me, dear.

The Wife (cheerfully)—I haven't been sitting up for you, dear. I've just come in myself.—*New York Press*

## She Hit It.

A little colored girl was called upon at school to write a sentence on the blackboard containing the word "delight." This is what she wrote: "Where was Moses when delight went out?"—*Truth*.

## Where He Kissed Her.

"And he kissed you?"

"Yes, and right under mother's eyes."

"I should think he would have preferred to do it under your own."—*New York Press*.

# Engineers and Firemen!

## STANDARD LITERATURE.

**These Books Will Help You to Master Your Calling and Get "On Top."**

***"Locomotive Catechism,"*** by ROBERT GRIMSHAW. Nearly 400 pages. Full of cuts and illustrations. Fresh from the press and fully up to the times; **Price, \$2.00.**

***"New Catechism of the Locomotive,"*** by M. N. FORNEY. More than 700 pages and more than 500 engravings. Greatest book published. **Price, \$3.50.**

***"Compound Locomotives,"*** by ARTHUR T. WOODS. The only book on the subject. Should be in the hands of every student of the locomotive. **Price, \$1.**

***"Air Brake Practice,"*** by J. E. PHELAN, of the Northern Pacific R. R. An exhaustive treatise on the Air Brake; explains in simplest language how to operate it under all conditions. **Price, \$1.00.**

***"Progressive Examinations of Locomotive Engineers and Firemen,"*** by JOHN A. HILL. A capital little book for new beginners. An excellent pocket companion. **Price, 50 Cents.**

***"Alexander's Ready Reference,"*** by S. A. ALEXANDER, for engineers and firemen. This book contains more valuable information in fewer words, and is easier understood by railroad men than any other book now in print. **Price, \$1.50.**

***"Twenty Years with the Indicator,"*** by THOS. PRAY, JR., M. E. Copiously illustrated and containing many rules as to the best way to run any steam engine to get the best results. **Price, \$2.50.**

***"Simple Lessons in Drawing,"*** by ORVILLE H. REYNOLDS (Chief Draftsman, Northern Pacific Railway). A splendid book. Every student of locomotive engineering and every explorer in the field of mechanics should have it. **Price 50 cents.**

***"Roper's Hand Book of the Locomotive,"*** by STEPHEN ROPER. One of the most valuable treatises ever written on the subject. It is fully illustrated, and contains a description of the most approved locomotives in use. **Price, \$2.50.**

***"Locomotive Running Repairs,"*** by L. C. HITCHCOCK. A splendid little book for locomotive men. **Price, 50 cents.**

Do You Want a Picture of the

## FAMOUS "999" LOCOMOTIVE?

We've had hundreds of letters asking for a picture—now we have it. Something better than a photograph. A **transparent**, copper-plate engraving of the famous flyer; you can see everything **outside** and **inside**. Every part is numbered and named. Fit for a gold frame in a palace. Printed on satin gloss paper, 14x28, and mailed in a tube (without folding) for 50 cents (stamps are good, but we would rather have postal notes or money orders). This is an educational device, up to date, unique, beautiful and correct. Once seen, no other picture of this beautiful locomotive will satisfy you at all. Send cash with order. **LOCOMOTIVE ENGINEERING, 5 Beekman St., New York City.**

If you are a subscriber, for 1894, to our paper, **Locomotive Engineering**, you get the above picture and our other little school masters, the **Traveling Engineer's Examination Chart** and the **Working Model of the Triple Valve**,

► **FREE.** ◄

The paper has over 40 large pages and is the best illustrated and "**most interesting railroad paper published.**" Practical, instructive, interesting! No engineer, fireman or shop man can afford to be without it. Sent to any address in the world for \$2.00. Angus Sinclair and John A. Hill, Editors. Specimen Copy, free. Address

# PERFECT RAILROAD WATCHES

HIGHEST GRADE

ROCKFORD

WATCH CO.

15 JEWEL

MOVEMENT.

GUARANTEED

TO PASS

RAILROAD

INSPECTION.

**COSTS NOTHING  
TO EXAMINE.**

**Jos. Fahys & Co.'s "Montauk,"** dust proof, open face case, 14k gold filled, screw back and bezel, neatly and artistically engraved, and accompanied by the manufacturer's signed guarantee to wear for fifteen years. Fitted with No. 87 Rockford movement as described below,

**\$22.50.**

**American 14k Gold Filled Hunting Case,** elegantly engraved and finely finished, and accompanied by the manufacturer's own guarantee to wear for twenty years. Fitted with No. 84 Rockford movement as described below,

**\$25.15.**

The No. 87 Open Face and No. 84 Hunting Movements are the highest grade 15-jeweled movements made by the Rockford Watch Co. They have fifteen finest ruby jewels, in solid gold settings, Breguet hair-spring, patent micrometer regulator, fancy or double sunk dials, and are elegantly damaskeened in gold on solid nickel. They are fully adjusted to heat, cold and positions, will pass railroad inspection, as they comply with the requirements of railway time orders, and are acknowledged the best movements ever offered for the money.

With each movement is sent a signed and numbered guarantee and our agreement to clean and oil movement once a year for five years from date of purchase.

For the benefit of those who do not wish to purchase higher priced cases, we will furnish these movements in **Dueber Silverine Cases** at the following prices: No. 87, \$15.95; No. 84, \$16.60, and will allow a credit of 75 cents for the open face and \$1.25 for the hunting case (when returned) on any purchase of a solid gold or gold filled case for the movement made within one year..

**Samples** of these watches can be seen and purchased for above prices at any Express Office in the United States. If the agent of the express company doing business in your town has not samples on hand, write us, giving his name and name of the company, also stating which watch you wish to examine, and we will at once forward samples for your inspection. If the watch is satisfactory, pay the agent our price and he will deliver it to you, otherwise you do not pay a cent.

# Marks' Patent Artificial Limbs

## WITH RUBBER HANDS and FEET

ARE NATURAL IN ACTION, NOISELESS IN MOTION AND THE MOST DURABLE IN CONSTRUCTION.

Over 15,000 in use, scattered in all parts of the world. Eminent surgeons and competent judges commend the Rubber Foot and Hand for their many advantages. At every industrial exhibition where exhibited they have received the highest awards. They are endorsed and purchased by the U. S. and foreign governments. A treatise, containing 430 pages, with 300 illustrations, sent FREE; also a formula for taking measurements, by which limbs can be made and sent to all parts of the world with fit guaranteed.

To A. A. MARKS:

DEAR SIR: I was a professional tight rope walker and acrobat before I lost my leg, and I do not allow the loss of a leg to compel me to seek another occupation. With your patent artificial leg I can walk a tight rope nearly as well as I ever could. The rubber foot enables me to balance with safety. The absence of an ankle joint removes the risk of falling to a large degree.

While walking on the ground I never feel the necessity of looking for uneven or bad places. I feel safe and sure on my rubber foot, no matter where I place it. I consider your invention of the rubber foot the most valuable and important to persons who have lost their natural limbs than any invention that has been made.

If any person doubts my ability to walk on a tight rope with an artificial leg applied, I will wager \$100.00 with them that I can perform for 30 minutes on a one and one-half inch rope elevated fifty feet above the ground.

Respy's yours, PROF. F. E. JACOBY,  
157 Bank St., Waterbury, Conn.

RECEIVED THE HIGHEST AWARD AT  
WORLD'S COLUMBIAN EXPOSITION.

ADDRESS

A. A. MARKS,  
701 Broadway, N. Y. City.

## "PULL YOUR LEG"

Is less to fear with Railroad men than to Lose Your Leg. In the latter case you surely want to replace it with a **Patent Adjustable Slip Socket**. Warranted not to Chafe the Stump. Received the Gold Medal and the Diploma at the World's Fair.

**LARGEST FIRM IN THE UNITED STATES.**

The Inner Socket, seen outside the limb in cut, is made over a plaster cast of the stump, giving an exact fit, being held permanently upon the stump by elastic fastened to lacer above, and in act of walking moves up and down in the Outer Socket, bringing all the friction between the two sockets, instead of between the stump and the socket as is the case of all wooden socket limbs. With our SLIP SOCKET the most tender, sensitive stump can be fitted and limb worn with perfect ease and comfort. Endorsed and purchased by United States Government. Send for our New Catalogue with illustrations

 1 Fenchurch Ave., London, England.

The Pocahontas Coal is acknowledged by all railroads that have used it to be the best American coal for Locomotive use. It generates steam with great rapidity, and at the same time holds the fire an unusually long time. The merits of the coal are shown by the unprecedented growth of the mines, which were not opened until 1883. Since that time the out-puts have increased over 1,200 per cent. beyond all precedent, amounting during 1892 to 3,000,000 tons. During the present year it will be at least 2,000,000 tons. We are therefore prepared to fill all orders with prompt dispatch.

### WHAT THEY SAY ABOUT OUR

ELDON, IA., Dec. 18, 1893.  
DEAR SIR:—Please send me one of your seats for locomotive use. I find that they are the best seat for engine use that I have seen yet. I want it 24 inches long and 20 inches wide. Weight, 170 pounds. Send it C. O. D.

Yours respectfully,  
(Signed) **W. T. Brown,**  
Engineer C. R. I. & P. R. R.

We refer by permission to the following users: D. J. Crowley, Engineer S. F. & W. Ry., 16 Jones St., Savannah, Ga.; Jno. Horton, Engineer Grand Junction, Colo.; Wm. Malloch, Engineer G. T. Ry., Belleville, Ont.

## ALL STEEL CAB SEAT.

**ROUGH RIDING MADE EASY.** Just put this seat in the box and lay your cushion on it. Made only of finest tempered steel spiral springs, heavy band steel bottom frame, and tempered woven wire fabric. Any size or shape desired. Usual size, 18x24. Price for seat not over 24 inches long, \$2.00. Terms, C. O. D. or cash with order. Please give your weight.

## Galena Oil Works, Limited. FRANKLIN, PA.

### SAFETY, SPEED, ECONOMY

Are the results of the use of Galena Oils. Scientific and practical tests of the past twenty years have demonstrated the fact that Galena Oils are superior to any other oils in the market.

Galena Oils in winter stand a cold test of from ten to fifteen degrees below zero, and will not freeze in the coldest weather.

The superiority of Galena Oil is demonstrated by their exclusive use upon a large majority of the railways of this country. They are in use upon three continuous lines of railways from Boston and New York to the Pacific coast and on one to the City of Mexico, thus demonstrating their adaptability to all climates and all temperatures.

We also supply our patrons with Sibley's Perfection Valve Oil, which is in exclusive use upon a large majority of the leading railroads of the country.

# Self-Acting Injector of 1887.

**NOTE**—There are many injectors which will work well when the conditions are favorable. This injector is designed to work well under all conditions and is, therefore the most reliable.

**IT WILL RE-START ITSELF.**

**IT WILL ADJUST ITSELF.**

**IT WILL LIFT HOT OR COLD WATER.**

Its range of capacity is over 60 per cent. and it can be regulated, therefore, to work continuously for light or heavy trains. It is operated by a simple lever motion which readily starts and stops its action.

## BROOKS LOCOMOTIVE WORKS,

Dunkirk, N. Y.

Compound Locomotives for Passenger and Freight Service.

Builders of Locomotive Engines for any required service from our own designs or those of purchasers. Perfect interchangeability and all work fully guaranteed.

M. L. HINMAN, Pres't and Treas.

R. J. GROSS, Vice Pres't.

D. RUSSELL, Superintendent.

F. H. STEVENS, Ass't to the President.

T. M. HEQUEMBOURG, Sec'y.

H. TANDY, Ass't Supt.

New York Office,  
46 Broadway.

E. A. ALLEN,  
Agent.

JOHN S. COOKE, Prest. and Genl. Man'  
FRED W. COOKE, Vice Prest.  
WM. BERDAN, Sec'y and Treas.

Paterson, New Jersey.

**COOKE LOCOMOTIVE AND MACHINE CO.** (Formerly Danforth Locomotive and Machine Co.)

**PATERSON, NEW JERSEY.**

ESTABLISHED 1831

# Baldwin Locomotive Works.

ANNUAL CAPACITY, 1,000.

## Locomotive Engines

Adapted to every variety of service, and built accurately to standard gauges and templates. Like all parts of different engines of same class, perfectly interchangeable. Broad and Narrow Gauge Locomotives; Mine Locomotives by Steam or Compressed Air; Plantation Locomotives; Noiseless Motors for Street Railways, Furnaces, etc. **Compound Locomotives.**

**Burnham, Williams & Co., Proprietors,**  
Philadelphia, Pa.

EDWARD ELLIS, President.  
WM. D. ELLIS, Vice-President and Treasurer.

A. J. PITKIN, Superintendent.  
A. P. STRONG, Secretary.

## Schenectady Locomotive Works,

SCHENECTADY, NEW YORK.

Locomotives of Standard Design for all Classes of Service, or from  
Designs Furnished by Railroad Companies.

### COMPOUND - LOCOMOTIVES,

Showing an Economy of 15 to 25 Per Cent. in Fuel and Water.

ANNUAL CAPACITY, 400

When addressing our advertisers mention this Magazine.

# LOCOMOTIVE FIREMEN'S MAGAZINE.

SEPTEMBER, 1894.

## THE PERVERSITY OF LAW.

BY WILFRED P. BORLAND.

The utter perversity of that thing called "law" is something fearful to contemplate. It works at cross purposes entirely; it is almost impossible to tell where it is going to strike or whom it will hit. There seems to be only one thing certain about it, and that is, if you want a law for one purpose you must make one that is ostensibly for a totally different purpose, in order to accomplish your object. There is a science of law making which our statesmen have not yet studied sufficiently. The science of the matter is that they ought not to proceed straight at their object in such an open, bull-headed manner, but should proceed by roundabout methods; make it appear that they want something different, and then the thing that they really do want will come as a consequence. It would be a good thing for the government to appoint a commission to develop this science of law. Facts might be collected and classified in such a manner as would be a great help to our law makers in their noble work of legislating for the good of the people, but the old, worn out canons of logic would certainly receive a terrible shock. The real science of the matter would explain the failure of our legislators to accomplish things for the people which they have been earnestly trying to accomplish for so long. It might even furnish an impregnable theory upon which they might proceed to settle without further difficulty that much vexed question of tariff reform. It would certainly appear that our legislators were wrong in letting it be known that they wanted tariff reform, and the science of the matter might teach that the proper way to secure tariff reform was to pass a law requiring every citizen of the United States to wear wooden shoes. Or it might appear that the proper sort of a law for the restriction of immigration would be one compel-

ling people to cut their hair short, or to go to church on Sundays. Anyway, there is a wide field for investigation, and the true connection between cause and effect in this field of action ought to be established so clearly that "he who runs may read." Look, for instance, at that magnificent instrument, the inter-state commerce law. There was a law that was enacted to protect the people against the exactions of the railway corporations, but it has never done it. The law has been on our statute books for seven years now, and beyond furnishing fat situations for a few worn out politicians it is as useless as though it had never been enacted. Not a single one of its ostensible objects has been accomplished. The law has been openly and shamelessly violated, and when its violators have been called to account they have escaped conviction and punishment on petty and transparent technicalities, until it has come to be regarded as a mere waste of time and money for the government to attempt to enforce its mandates regarding inter-state commerce. The corporations have even ceased to oppose the law, its provisions are so easily violated. One railroad president, Mr. Stickney, publicly said that "If all who have offended against the law were convicted there would not be jails enough in the United States to hold them." And this has been going on ever since the law was enacted.

Here is a significant passage from a recent report of the inter-state commission: "It may be fairly claimed that much greater benefits would have been realized had the statute as enacted expressed the evident purpose of those who framed it, and received a construction according to its apparent import. It is not too much to say that judicial interpretation has limited its scope and ascribed to it an intent not contemplated when it was passed. If its supposed meaning, as understood at the time of its passage, had been upheld by the courts, it is believed that its operation

would have been much more effective and its usefulness greatly increased. So far as failure has attended the efforts to give it proper administration, that failure can be mainly attributed to differences between its apparent meaning and the judicial interpretation which some of its provisions have received."

There is vaguely perceived the necessity for that science of law making of which I spoke above. Isn't it perfectly conceivable that the mistake in the first instance laid in the fact that, instead of an inter-state commerce law, they did not enact a law requiring locomotive engineers to wear standing collars, or compelling locomotive firemen to wear Peters' overalls? What a terrible mistake we have made in not attempting to develop that science sooner. I take great credit to myself for suggesting the matter even at this late day. I feel sure that fame and fortune await me as soon as I get the idea a little further along. If there are any political scientists who are out of a job, and who want to aid me in putting the science on a working basis, they had better apply right away, so as to get themselves in on the ground floor. Look at the result! All at once this useless thing springs into life; its form is instinct with life and power; its grand potentialities are recognized, but in a direction its projectors never thought of at all. Verily, the law is wonderfully afflicted with ataxia, and its ways are hard to determine.

Who would have thought that this law, which was enacted to restrain the robbing tendencies of the railroads, was such a powerful force in another direction as it has proved itself to be? Who would have thought that a law of that sort was competent to invest the general government with sufficient power, and the kind of power, to call out the whole military force of the country to shoot down strikers, in aid of the very corporations whose villainies it was aimed to suppress by the law? But, there is the fact staring us in the face, and what is to be done about it? Is there any man so sunk in ignorance as to deny that we need a new science of law making? The peculiar thing about the matter is that the government never rose to a realization of the supreme importance of sustaining the majesty of this law until after it had become warped and twisted so as to make it operative against the very people it was not intended to hit, and to apply to acts and conditions that entered not into the original theory at all. For the past seven years the law has been in existence, and the people against whom it was directed have paid no more attention to it than as though it had never been enacted; and all this time the government has been as meek as a mouse. But the moment it is dis-

covered that the law can be strained so as to make it hit somebody else, the government becomes as bold as a lion, and suddenly discovers that the majesty of the law must be supported at all hazards, even if it takes the whole strength of its military arm to do it.

Now, make no mistake about it, the inter-state law has a new lease of life, a new object to live for, a new purpose to fulfill, and it becomes a force in this country from this time forth. Henceforth, all the power of the general government will be put forth to sustain and enforce this law, but it will not be against the Counsellmans, the Gowans, the Depews, or the interests they represent, it will be against the employees of the railway corporations. Chauncey Depew cables to the *London Times* that "Congress, in enacting the inter-state law, had assumed to regulate commerce between the states, and unconsciously with it the responsibility to keep open inter-state lines as national highways." There we come right back to that question of perversity in the law again. It seems impossible to get away from it, turn which way we will. The power that was attempted to be exercised, *consciously*, was never exercised at all; it was no power. But the power that was assumed *unconsciously*, that which was not realized, is active and potent; it was, and is, the only power in the law. If there is not a field for investigation, I don't know where one would go to look for it.

In the issue of July 13th, the *Railway Age* asks the question: "Can there be such a thing as a lawful strike on any railway engaged in inter-state commerce?" After examining this question at some length the *Age* answers it in the negative; and its answer is eminently correct.

Whether we may like it or not, the facts of the situation are just to place railway employees in this position: The moment they enter upon a strike their quarrel is no longer with their employers, or the interests they represent, *it is with the government of the United States*. They are no longer in the position of employees trying to force concessions they are entitled to from the hands of their employers, but in the position of rebels, insurrectionists against the government; they must overthrow the whole power of the government in order to win their strike.

How this condition has been brought about is a matter of secondary importance just now; the question involves a long story of outrage, oppression, and defiance of the people's rights that cannot be entered into just here; but it illustrates the perversity of law, and the point I want to emphasize is that the condition must be dealt with as it actually exists.

In the course of a lecture to the daily

press, in the columns of the *Railway Age*, "Auditor" puts the case just this way: "The daily press forgets that *any railway strike* just as soon as it stops (whether by open violence or by intimidation) one train engaged in commerce between states becomes from that instant criminal and a defiance of the authority of this government." That's his language, emphasis and all, and for this once that monumental pervaricator must be given credit for telling the truth. That is the exact theory upon which the powers that be proceed to interpret the inter-state commerce law, and it requires very little straining of the theory to turn the most innocent acts of a body of strikers so as to make them conform with the definitions of conspiracy or insurrection and place strikers in the attitude of rebels. There is probably not a single provision of the inter-state law but has been violated by every railway corporation in the United States times without number, and that with the utmost impunity, and there is something ghastfully incongruous in the fact that the only effective use that has ever been found for the law has been to repress strikers and bring them into subjection to conditions against which they rebelled; but there is the fact, and what is to be done about it? If the government has so much power to enforce this law in one direction, is it not pertinent to ask why has it not the same power to enforce it in another direction? Is this law to be enforced against one class of citizens while another class are allowed to violate its provisions with impunity? Is it to be believed, or is it the proper thing to believe, that this government has power enough to compel railway employes to observe the spirit of the law, as interpreted by the courts, while it is powerless to compel railway corporations to observe the letter of the law? Suppose it had been thoroughly understood from the start that the government was powerful enough, or was disposed to use its power, to enforce the law against the corporations, to exert the whole force of its military arm to force the corporations into obedience to its mandates, does anyone suppose that the law would have been the dead letter that it has been? There is no room for any such a supposition. Then why is it that the power of government is not exerted so as to compel the corporations to observe the law? Aye, there's the rub; why is it not? Simply because the corporations are above the law; they are stronger than the government; the laws cannot touch them; the only laws that the government can enforce are such laws as are not antagonistic to the corporations, or those whose enforcement will be in their interests. When the corporations and their sycophantic agents, like Archbishop Ireland, for instance, are crying out

with such a loud voice for the enforcement of law and order, the word "law" is a useless and meaningless word. They don't mean "law" at all, they simply mean "order;" they use the word "law" simply through force of habit, or for its alliterative effect. They care nothing about law, all they want is order. No matter that their own acts may have been the means of producing disorder, that cuts no figure; they are above the law and cannot be called to account; but the poor miserable dupes who are not above the laws must be forced into order at all hazards. Social order is certainly something that must be maintained, and it is about time we made up our minds to secure social order by putting a quietus on those who are responsible for social disorder. Social order is not to be arrived at by a display of guns and bayonets; it is to be obtained by simply doing justice, and it must be understood that the laws which are regarded as necessary for the maintenance of social order are just as binding on one class of citizens as they are on another, just as necessary to be observed by the rich as they are by the poor. If the theory is correct that regards all our laws as necessary for the protection of property and the maintenance of order, then there must be no half way measures about it at all, but the laws must be obeyed *in toto*. There is no place in our theory of government for the doctrine that any part of our population are superior to the laws; the laws must be enforced impartially or not at all. If the rich have any right to break the laws the poor have the same right; and if the army is to be called out to force the poor into submission to law, then must it be used for the same purpose whenever the rich are concerned. This remarkable reverence for law should not be allowed to go to seed among that class that exhibits it; it should be diffused over our whole population so that all may profit by whatever good there is in it. In delivering himself of some profound opinions concerning the Pullman strike, Archbishop Ireland says: "Labor must learn that however sacred its rights are, there is something above them and absolutely supreme—social order and the laws of public justice. There is no civil crime as hideous and pregnant of evil as resistance to law and the constitutional authorities of the country. This resistance is revolution; it begets chaos; it is anarchy; it disrupts the whole social fabric which insures life and safety to the poor as well as to the rich, to the employe as well as to the employer."

In delivering himself of this apotheosis of law, the worthy archbishop probably did not intend to hit the big guns so hard as he did, but it is always dangerous to play with fine phrases, and in attempting to uphold

social order as against the excesses of the few poor dupes of the law he has unconsciously delivered a stinging rebuke to his patrons and admirers. "There is no civil crime as hideous and as pregnant of evil as resistance to law and the constitutional authorities of the country." Why don't he thunder that into the ears of the monopolists and shylocks of the country upon every possible occasion? Why don't he reiterate it from his pulpit and through the press of the country until it is brought home to the understanding and the conscience of every lawbreaker in this country, be he rich or poor, great or small, Jew or Gentile, Christian or infidel? Well, there is good reason why he does not; it doesn't do for these Christians for revenue only to speak such sentiments except when they are applicable only in one direction, or, rather, when they can be made to appear so. And whatever these Dogberrys may say, there is nothing superior to the rights of labor. The rights of labor is the question that is absolutely supreme; it is above all other questions; all other considerations sink into positive insignificance when measured by this one, because until the rights of labor are fully recognized we shall never have true social order. Standing armies and displays of military force cannot maintain social order. Repression is not the remedy for oppression. When the workingmen get their rights we shall have social order, and not before; and if those rights cannot be got without a revolution, then the revolution must come; all the military force in Christendom cannot prevent it. "After me the deluge," is a mighty poor motto for our plutocratic masters to act upon now, because we have reached a period in the march of our destinies when it is absolutely impossible for anyone to declare with certainty just how soon the deluge is liable to arrive, if present conditions are allowed to continue, and those who hope to escape the deluge may wake up some fine morning to find themselves engulfed. These monopolists and privilege mongers seem to be incapable of learning anything from the experience of their prototypes in past historical periods. They are not able to see that the civilization they are so much in love with cannot be maintained on the basis of privilege, no more in this age of the world than it could be in past ages, and all their efforts are directed towards keeping the workingmen in order whilst preserving their own privileges intact. They will wake up some fine day to the discovery of their mistake.

In philosophizing on the course of history, Professor Ridpath says: "When the iron jaws of monopoly have once closed on the marrow-bone of privilege, they have never relaxed until they were broken." Is it pos-

sible that these great lovers of order, and of civilization, have not the courage to reverse this dictum of philosophy? It begins to look that way. The attitude of these privilege mongers towards that instrument of law, which they are so insistent that workingmen shall observe in the interest of order, is one of supreme contempt. Look at Mr. Pullman, for instance. The laws which permitted him to oppress his employees were lived up to for all they were worth, while the laws which were calculated to free his employees from oppression were entirely ignored. There are many instances where employees received for two weeks' labor, after deducting rent and water and gas rates, all of which are under the control of the Pullman company, from one cent up to one dollar. That to purchase the necessities of life for themselves and families! But such outrages as that might be perpetrated according to law, and when Pullman was grinding his employees in that manner he was a law-abiding citizen. Other cases are numerous enough, however, where laws were directly violated whenever they favored the employees or conflicted with Pullman's interests. The law of the state of Illinois requires corporations to pay their employees weekly, but Pullman pays his workmen semi-monthly. It would be idle for workingmen to attempt to force Pullman to observe the weekly pay-day law, as to do so would only be to throw themselves out of situations; but isn't it a wonder that persons who are capable of developing so much respect for law as Pullman and his like have shown lately, should be willing to place themselves in the attitude of law breaker, to any extent whatever? Cases are numerous where, if an employee earned—say \$25 in two weeks, and his rent, water and gas rates amounted to \$17, and he owed the company \$10 back, not only would the \$17 be retained, but the remaining \$8 of the \$25 earned also, to apply on the \$10 back. The labor laws of Illinois forbid that sort of work, but what does Pullman care for the labor laws, or any other laws for that matter, when they interfere with his own laws? Wherever the state laws conflict with the Pullman laws, the latter always prevail. And why should they not? The state laws are merely supposed to represent the will of the sovereign people of Illinois, while the Pullman laws represent the will of George M. Pullman. It would be absurd to attempt to place the latter in subordination to the former. In fact, it is never intended that the laws which are placed on our statute books in the interests of the workers are to be observed by the capitalists. The lovers of law will find that out after a while. There is not the slightest intention of enforcing laws that limit the privileges of capitalists, or forbid them from entering into conspira-

cies which involve the most barefaced schemes of robbery of the workers; those laws are merely thrown out as a bait to catch the votes of the workers. Our law makers are naught but a pack of highway robbers, an organized band of pirates and freebooters; none but thieves and scoundrels can remain in the business of law making and make a decent living at it. The one who tries to be honest loses influence so that his honesty does not count, or else he is kicked out of office for fear his honesty may do some harm. And it is to this pack of highway robbers that we have entrusted the business of making regulations for the maintenance of social order! The very idea is sickening. The experience of an honest legislator in the state of Iowa is graphically presented by Hanlin Garland in "A Spoil of Office."

"Bradley Talcott, an honest young farmer, is elected to a seat in the legislature and goes to the capital with high hopes of reform and a totally inadequate idea of the character of the average legislator. The first three or four weeks of legislative life sickened and depressed Bradley. He learned in that time not only to despise, but to loathe some of the legislators. The stench of corruption got into his nostrils and jovial vice passed before his eyes. The duplicity, the monumental hypocrisy of some of the leaders of legislation made him despair of human kind and to doubt the stability of the republic. He was naturally a pure-minded, simple-hearted man, and when one of the leaders of the moral party of his state was dragged out of a low resort, drunk and disorderly, in company with a leader of the senate, his heart failed him. He was ready to resign and go home. Trades among the committees came obscurely to his ears; hints of jobs, getting each day more definite, reached him. Railway lobbyists swarmed about and began to lay their cajoling, persuasive hands upon members, and he could not laugh when the newspaper said, for a joke, that the absent-minded speaker called the house to order one morning by saying, 'Agents of the K. C. & C. will please be in order.' It seemed too near the simple fact to be funny. The school book lobby, the university lobby, the Armour lobby, each had its turn with him through its smooth, convincing agent."

"He reached his lowest depth one night after a conversation with Floyd Smith, an ex-clerk, and a couple of young fellows who called upon him at his room. Floyd noticed his gloomy face and asked him what the trouble was. He told them frankly that he was disgusted."

"Oh, you'll get used to it!" the ex-clerk said. "When I first went into the house I believed in honesty and sincerity, like yourself, but I came out of my term of

office knowing the whole gang to be thieves. My experience taught me that legislators in America think it's a Christian virtue to break into the United States treasury."

"The others broke out laughing, believing him to be joking, but there was a ferocious look on his face, and Bradley felt that he might be mistaken, but he was not joking."

"They stole stationery, spittoons, waste baskets. By God, they stole every thing that was loose and at the end of the term they seemed to be looking around unsatisfied, and I told 'em there was just one thing left—the gold leaf on the dome."

"The others roared with laughter, and Bradley was forced to join in. But the face of the ex-clerk did not lose its dark intensity."

"Take salary grabbing. Why they wanted me to certify to their demands for Sunday pay for themselves and their clerks, and I refused and they went wild. I'm not an angel nor a Christian man, but I won't sign my name to a lie, and blamed if they didn't pass the order without my signature! Yes, sir; it's there on record."

"Take nepotism. The members bring their wives and daughters down here, put them in as pages and clerks, or divide the proceeds when they have no relatives. Every device, every imaginable chicanery, every possible scheme to break into the state money box is legitimate in their eyes and worthy of being patented. Public money is fair game, and yet," he said, with a change of manner, "we have the fairest, purest and most honorable legislature, take it as a whole, that there is in the United States, because our state is rural and we're comparatively free from liquor. Our legislature is a Sunday school compared to the leprous rascals that swarm about the capitol at Albany or Springfield."

"What is the cure?" asked Bradley, whose mind had been busy with the problem."

"God Almighty! There is no cure except the abolition of government. Government means that kind of thing. Look at it! Here we enthrone the hungry, vicious, uneducated mob of incapables and then wonder why they steal and gorge and riot like satyrs. The wonder is they don't scrape the paint off the walls."

"Oh, you go too far. A legislator would not steal a spittoon."

"No, but the fellow he recommends for clerkship does."

"My idea is that there are very few men who take money."

"I admit that; but they'll all trade their job for another job. Honesty is impossible. The angel Gabriel would become a boddler under our system of government. The cure is to abolish government."

"This conclusion, impotent to Bradley,

was practically all the savage critic had to offer. Either go back to despotism or go ahead to no government at all."

This is a picture true to life, as any person who knows much of our legislative affairs will admit, of the average law-making body in this republic; and it will serve to explain in great measure the perverse action of the thing called "law." Senator Beck said, upon the floor of the United States senate chamber, that "it is impossible to have an honest legislature, state or federal, so long as representatives are sent who owe their election to or are personally interested in great moneyed corporations or monopolies. No matter whether they call themselves Democrats or Republicans, they are not the representatives of the people; they are simply the agents or attorneys of those who seek their own aggrandizement by taxing the masses." Many of our old common law maxims read nicely, and it is supposed that they furnish a stable basis for the theory of law, but they are entirely meaningless; they merely serve to give an appearance of respectability to the Christian theory, they are never observed in practice. One of those old maxims, *legis constructio non facit injuriam*—"the interpretative construction of the law shall wrong no person"—might as well be expunged from the legal records, as it is no longer binding. The interpretative construction of the law harms every person connected with it, even those whom it construed so as to benefit, in nine cases out of ten. Look at the anti-trust law of 1890. Not a single one of its provisions have been enforced, or even been attempted to be enforced against the trusts; it is "anti-trust" only by its title, but a federal judge found occasion to interpret this law so as to make it operative against a labor union in New Orleans, and now another federal judge in Chicago has seen his way clear to the interpretation of this law so as to make it operative against Mr. Debs and his associates. Here is another law that was enacted to suppress monopolies of capital, but it is only useful in suppressing monopolies of labor. Monopolies of either sort are not the thing, but they must be treated alike; the law that touches one without touching the other with the same force is entitled to no respect whatever. Law is effective only in proportion as it is felt to be just. Unjust laws cannot long exist in this country in this age of enlightenment, and in this fact lies the hope of the laboring masses. A little more pressure, a little more tightening of the screws by their capitalist masters and the laboring masses will be ready to rise in their might and sweep the whole miserable code of unjust and iniquitous laws which afflict them as with a leprosy into well merited and well earned oblivion.

## A REVELATION.

BY MARIE LOUISE.

What is the true position and the real power of the capitalistic class, and what is the true position and real power of the toiling class in this republic at the present time, are questions which, previous to the great railroad strike, but a few persons could answer with accuracy. The masses of the people put a blind faith in the adequacy of a republican form of government to protect and preserve popular liberties. They viewed without alarm, nay, with equanimity, the stupendous growth of monopolies, the building of princely fortunes, the erecting of colossal factories, the forming of trusts, combines and mighty corporations, never questioning whether the rapid growth and concentration of fortunes operated not against their own opportunities to earn their livelihood. They saw a new and strange phenomenon appear—the tramp. They wondered at his repulsive aspect and attributed his condition to a lazy instinct which made him select to beg and roam instead of working. The idea did not suggest itself that the degradation of the poor wretch had a reflex action on them, they failed to notice the coincidence which brought to the surface of society at one and the same time the millionaire and the tramp. On all these significant manifestations the working class remained blind. To preserve what they considered fair wages they organized trades-unions, elected leaders and became absorbed in the warfare these leaders kept lively among themselves and the organized bodies.

The capitalists on their side rejoiced to see the workingmen sinking considerable money and time into labor organizations the very nature of which was a certificate for the permanency of the present wage system. They encouraged and lauded those societies, praised the "noble, manly bearing" of the men who paraded on labor's day, exalted the magnificent brilliancy of the turn-out and rewarded in *diverse ways* "efficient and level-headed" leaders, whose Janus faces at one and the same time looked grave and disciplinarian at their flock and gave a smirking wink to the capitalist spectators. The toilers, children-like, were furnished with toys of different kinds, and as long as the toys captivated their attention the monopolists felt secure in raking up more money, capturing more land, taking control of the seas, counting the votes cast by the masses, inaugurating presidents with military solemnity and monarchical paraphernalia, sitting on the benches of the congress and senate, increasing the number and the pay of the army and police, taking up and polishing anew obsolete laws of puritanic rigidity and performing

several other dexterous tricks of legerdemain.

The press of the country found it profitable to give elaborate accounts of the happy condition and satisfaction of the American workingmen, of their love for the laws and the constitution, of their solicitude for the preservation of the present highly gratifying economic régime, of their pride of our national institutions. The press further devoted columns to the publication of the princely gifts by multi-millionaires to their cherished and honored fellow-citizens of the working class, to the devotion and self-sacrifice of the millionaires' wives who leave their palaces to go slumming and sit on the only chair with four legs in the poor's room, and take on their knees the unkempt, unwashed, unfed, wasted form of a child of poverty-stricken parents. How enchanting the whole picture! Just glance at that dainty, well-dressed, well fed female millionaire sitting in the midst of dirt and strewed debris (sorrowful remnants of furniture) smiling on the ragged, hollow-cheeked, crippled forms of the wife and children of an American king, and bestowing alms with her gracious hand! Assuredly, when wealth has gravitated to such power, greatness and kind sympathy; when poverty has reached the last ditch of misery, is humble, patient and full of gratitude, the millenium has entered, for all reachable points above and below are reached and they harmoniously stretch out and link in the center.

Thus the perfidious tactics of a subsidized press succeeded in harmonizing the most antagonistic elements and coloring in gay tints the grimest of all pictures. Now and then a speaker or a writer would be rash enough to mention the sufferings of the poor and the unemployed and the iniquity of the economic conditions which produce the billionaire and the tramp. But they were soon silenced with scorn and railery, were called discontented idlers, maniacs and calamity shriekers, and sometimes (God forgive me for penning the word) the were denounced as *anarchists*!

The capitalists rested easy, everything around them appeared smiling and smooth—whatever of grim poverty there was, was hidden from view, whatever of wailing there was, was smothered by the cackling of a brainless, soulless press.

The poor and the unemployed suffered in that silence which hopelessness and despair create, attributing the woes, perhaps not to divine will, but to an inevitably irremediable calamity, under which they must groan until death or a favorable incident relieve them from their pains. Of late I have spoken with many, and, to my question, "What shall we do?" they invariably answer: "Nothing; we have to beg, starve and die; we dare not complain aloud or

show ourselves in day-light, for we fear the police and the jail. We must bear our misery until business gets better.
